FOREWORD

ANZ has been exploring the financial literacy, capability, attitudes and behaviours of Australian adults for almost 20 years. The 2021 Financial Wellbeing Survey, the seventh iteration in the series since 2002, includes updated modelling and is designed to improve our explanation and understanding of financial wellbeing.

In 2017, building on the work of Emeritus Professor Elaine Kempson, our survey evolved to consider for the first time how a range of factors drive financial wellbeing outcomes.[1] Since then, international research and practice in the areas of measuring and improving people's financial wellbeing have developed substantially.

This survey, undertaken in mid-2021, continues to draw on the pivotal work of Kempson *et al.* but importantly, also takes into account the considerable evolution in thinking about financial wellbeing and capability here in Australia and internationally in recent years.

Thank you to Stephen Prendergast (Prescience Research) and David Blackmore for their continued outstanding analysis, to Roy Morgan for its professionalism in conducting the survey in Australia and New Zealand and to Professor Elaine Kempson for her personal support and considerable insights.

We'd especially like to acknowledge our Australian Steering Committee members for their ongoing support, insights and guidance and for committing their time during a very challenging period (and a global pandemic). Special thanks to Laura Higgins (ASIC), Gerard Brody (Consumer Action Law Centre), Professor Roslyn Russell (RMIT University) and Professor Shelley Mallett (Brotherhood of St Laurence).

To the more than 5,000 participants across Australia and New Zealand who participated in this survey, thank you for your time, enthusiasm and contributions to a more comprehensive understanding of financial wellbeing in Australia and New Zealand.

FINANCIAL WELLBEING IS THE EXTENT TO WHICH SOMEONE IS ABLE TO MEET ALL THEIR CURRENT COMMITMENTS AND NEEDS COMFORTABLY, AND HAS THE FINANCIAL RESILIENCE TO MAINTAIN THIS IN THE FUTURE.

CONTENTS

1   Kempson *et al.*

EXECUTIVE SUMMARY

The 2021 Financial Wellbeing Survey represents an evolution in how we model financial wellbeing, drawing on developments in international research and practice in the areas of measuring and improving people's financial wellbeing.

This report aims to improve understanding of why people might behave the way they do, what is driving their behaviour and what factors, both internal and external, are 'blocking' and 'enabling' their financial wellbeing. The online survey, conducted over two weeks in May and June 2021, captured the views of 3,552 randomly selected Australian adults across different life stages and locations.

KEY FINDINGS

Through an updated modelling approach, we have a better understanding of how a person's socio-economic context and their behaviour traits are key to financial wellbeing.

The use of structural equation modelling (SEM) has given us a greater understanding of the causal linkages between each of the different drivers along 'pathways' to financial wellbeing.

The total impact of socio-economic factors and life events on financial wellbeing were substantially higher than our previous analysis was able to demonstrate. Socio-economic factors accounted for 54.5% of the explained variation in a person's overall financial wellbeing, while a person's behaviour traits such as whether they are more oriented towards the future, impulsive, optimistic or frugal accounted for a further 13.4%.[2] A person's stage in life is also an important part of their context. Not only does life stage influence financial wellbeing, it can be an important variable to consider when assessing and comparing overall levels of financial wellbeing.

We have updated our financial wellbeing measure to include 'feeling secure for the future.'

The research showed that in addition to a person's ability to meet everyday commitments, how comfortable they feel about their financial situation and their resilience to sustain financial shocks, whether people were **'feeling secure for the future'** was a key fourth dimension of financial wellbeing in Australia. To reflect its significance, we have adapted our model to incorporate it as an important fourth dimension in the measure of financial wellbeing and provide a longer-term view of financial wellbeing outcomes.

The average financial wellbeing score for respondents in Australia was **64 (out of 100)**. The bottom 11% were considered **struggling** (financial wellbeing score 0-30), 17% were **getting by** (financial wellbeing score >30-50), 43% were **doing OK** (financial wellbeing score >50-80) and the top 29% were considered to have **no worries** (financial wellbeing score >80-100).

People in the **no worries** group were much more likely to feel secure for the future, with 86% feeling they will be financially secure until the end of their life. They were also more likely to

exhibit investment behaviours and be more forward-looking and optimistic than other groups.

The lower a person's financial wellbeing, the higher their anxiety was about their future financial situation. Thirteen per cent of people in the **no worries** group strongly or somewhat agreed to feeling anxious about their future financial situation, compared to 43% of people **doing OK**, 63% of people **getting by** and 86% of people **struggling**.

Health, unemployment, earning potential and life journey are the most significant socio-economic factors affecting financial wellbeing.

The research showed a strong relationship between poor physical and/or mental health and financial wellbeing. In fact, it showed a stronger relationship than that between financial wellbeing and an individual's saving and spending behaviours.

While 28% of Australians reported their mental health as fair or poor, this was much higher for people with low financial wellbeing, with 46% of people **getting by** and 68% of people **struggling** responding that their mental health was fair or poor. Similarly, 27% of Australians reported having fair or poor physical health, increasing to 39% of people **getting by** and 57% of people **struggling**.

Unemployment had the second largest socio-economic impact on financial wellbeing. People who were **struggling** were also more likely to have been impacted by job loss or redundancy in the last 12 months during the pandemic. While 10% of Australians reported experiencing a job loss or redundancy, 27% of people who were **struggling** and 17% of people **getting by** had reported losing a job.

Earning potential was the largest socio-economic 'enabler' of financial wellbeing. While household income was positively correlated with financial wellbeing, an individual's level of post-secondary education was the largest contributor to their earning potential.

The impact of life journey on financial wellbeing is reinforced in the 2021 survey as having the second largest positive socio-economic impact on financial wellbeing. As people progress through life, they generally have some opportunity to improve their financial wellbeing through accumulating savings and wealth over time. As earnings also tend to improve with time spent in full-time work, the potential exists for these two things to be mutually reinforcing, at least until people retire.

Other socio-economic factors such as access to social support, financial stability, gender and providing financial support to dependents all had strong influences on financial wellbeing. This latest survey finds that socio-economic factors have a much greater bearing on financial wellbeing than previously thought.

Behaviour traits influence financial wellbeing in different ways. 'Forward-looking' behaviour traits tended to have the most significant impact on financial wellbeing.

The research showed that optimism, future orientation, impulsivity and frugality had the strongest influences on financial wellbeing. These different financial behaviour traits influence financial wellbeing along different pathways, through either improving financial confidence and control or saving and spending attitudes. Whether an individual is future oriented, impulsive or frugal influences their attitudes to saving and spending (whether they have more of a saving or spending mindset). Their level of optimism influences how confident and in control they feel about their finances.

Behaviours still have a role to play in building resilience against life's ups and downs.

Financial behaviours including saving and spending behaviours, investment behaviours and money management behaviours still have a role to play. Together they account for 19.3% of the explained influence on financial wellbeing.

Saving and spending behaviours – active saving, not borrowing for everyday expenses and spending restraint – continued to have the strongest influence out of all financial behaviours. These behaviours support people to accumulate financial health and are therefore key to ensuring people have the financial resilience to lessen the impact of socio-economic disruptions on financial wellbeing, particularly during the COVID-19 pandemic.

The inclusion of a fourth dimension – 'feeling secure for the future' – in the measure of overall financial wellbeing has highlighted how investment behaviours have a role in driving financial wellbeing. Whether a person exhibited strong Investment behaviours was influenced primarily by their level of financial confidence and control over their financial lives. It has also provided the potential for socio-economic factors and behaviours that relate to investment to have a role in explaining financial wellbeing.

Interventions in product and service design that encourage healthier financial behaviours and offset natural tendencies (e.g. high impulsivity) will make it easier for people to improve their financial wellbeing.

OTHER FINDINGS

While not a strong direct influence on financial wellbeing, financial knowledge can enhance people's sense of confidence and control over their finances.

Our analysis showed financial knowledge to have its strongest influence on financial wellbeing indirectly through its potential to enhance an individual's feelings of financial confidence and control. An improved sense of confidence and control in turn increases the likelihood of a person engaging in the types of saving, spending and investment behaviours that lead to higher levels of financial wellbeing. However, we did not find a significant direct relationship between financial knowledge and financial wellbeing.

Attitudes to saving or spending have a direct effect on how people save, spend and use credit.

People with a stronger savings mindset tended to have higher financial wellbeing. Attitudes to saving and spending were positively correlated with the value of savings and investments held, particularly for accumulated savings and investments up to $50,000. Similarly, people with more of a saving mindset had lower levels of consumer debt.

Financial confidence and a sense of control over our financial lives play a strong part in improving financial wellbeing through saving, spending and investment behaviours.

Financial confidence and control is thought to have a crucial role in the development of financial wellbeing. It has a strong influence on whether someone saves, spends or borrows for everyday expenses. In addition, financial confidence and control is a key driver of longer-term investment behaviours such as investing in property and shares. It is also seen to be influenced by financial wellbeing via a 'feedback loop' whereby an improvement in financial wellbeing improves one's financial confidence and sense of control.

While knowledge and optimism were the largest influences on financial confidence and control, improved financial wellbeing in itself influenced financial confidence. An individual's level of financial wellbeing had a similar influence on financial confidence and control as other behaviour traits such as goal and future orientation. This 'feedback loop' allows for saving, spending and investment behaviours to be reinforced through improved confidence from improved financial wellbeing.

Knowledge of online risks did not strongly impact financial wellbeing for most, with younger people the least confident in their knowledge.

While important, knowledge of online risk was not a strong driver of financial wellbeing. The average knowledge of online risk score was 78 out of 100 for the total population. This rose to 82 out of 100 for people with high levels of financial wellbeing but did not fall substantially below the national average for people with lower levels of financial wellbeing. People who were **struggling** had knowledge of online risk scores in line with the national average. Knowledge of online risk was lowest for people aged 18 to 24 years (72 out of 100) and highest for people in the two age groups 25 to 34 years and 35 to 49 years (80 out of 100).

Almost three-quarters of Australians (74%) felt confident in their knowledge of how to protect their security online, while 69% equally felt that they understood how to protect their privacy online. This response was consistent for most of the population over 25 years of age. However, younger people aged 18 to 24 years responded less positively about their understanding of how to protect their security (67%) and privacy (60%) online.
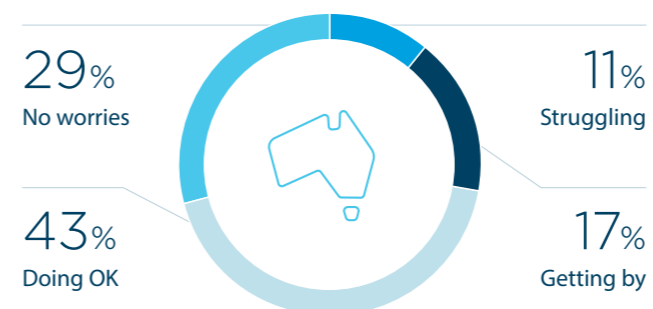

---

2   Overall, the structural equation model developed was able to explain 75% of the variation in people's financial wellbeing scores.

SURVEY EVOLUTION

This survey is the seventh iteration of ANZ's national survey of Australian adults' financial capability, attitudes, behaviours and wellbeing since 2002.

The 2017 survey adapted the Kempson *et al.* Conceptual Model of Financial Wellbeing. Since then, international research and practice in the areas of measuring and improving people's financial wellbeing have developed substantially. While largely maintaining agreement on the broad definition of financial wellbeing, recent research has delved into more specific detail about the different drivers of financial wellbeing and how they are measured. This has included an increasing focus on subjective versus objective measures of financial wellbeing, elevating the importance of sociodemographic and life-stage factors, proposing additional psychological traits as being important to financial wellbeing, and the inclusion of digital capability. A summary of key international developments since our 2018 report is included in Appendix A (page 35).

The 2021 survey and analysis continue to draw on the revised Kempson *et al.* model (2018) and take into account the evolution in international thinking about financial wellbeing and capability. The 2021 Financial Wellbeing Survey and analysis has been developed to improve the degree to which the model explains financial wellbeing.

This report presents key findings from our online survey of 3,552 randomly selected adults (over 18 years of age) conducted over two weeks in May and June 2021, a snapshot in time that has coincided with the most impactful pandemic in 100 years. In Australia, the fieldwork was commenced during a period of the pandemic where optimism was relatively high, cases of COVID-19 in the community were low and restrictions were minimal. While this sentiment certainly may have had some influence on overall results, we do not anticipate it would change our conclusions about the relative importance of different pathways to financial wellbeing.

2002

FINANCIAL LITERACY

Focus on 'financial literacy' = 'knowledge'. Some behaviour and attitude questions but financial literacy scores were mainly based on self-rated 'knowledge' and 'understanding' of financial products and processes.

2005

FINANCIAL LITERACY + BEHAVIOURS

More behavioural questions in the questionnaire (e.g. 'shopping around') but financial literacy score still entirely 'knowledge-based'.

2008

FINANCIAL LITERACY, KNOWLEDGE + UNDERSTANDING

Calculation of financial literacy score broadened somewhat to include three items measuring attitudes and behaviour although still dominated by 'knowledge'.

2011

BEHAVIOURS + FINANCIAL CAPABILITY

Shift from knowledge-based financial literacy to behaviourally-based financial capability although this continued to be called 'financial literacy'; drew on Elaine Kempson's work for the UK Financial Services Authority.

2014

FINANCIAL LITERACY + MOTIVATIONS

Used the same 'financial literacy' model as in 2011 with slight modification of 'attitudes' to include measures of three 'motivational traits'; attitude towards the future, impulsivity and achievement orientation.

2017

FINANCIAL WELLBEING

Adoption of Kempson *et al.* model of financial wellbeing, measuring components of social and economic environment; financial knowledge and experience; psychological factors; and financially capable behaviours.

2021

FINANCIAL WELLBEING – CONTEXT MATTERS

Application of revised Kempson *et al.* model of financial wellbeing in the Australian context, using structural equation modelling to measure the direct and indirect effects of socio-economic context, traits, attitudes, confidence and behaviours on financial wellbeing.

SURVEY CONTEXT

Financial wellbeing in a time of pandemic

The ANZ Roy Morgan Financial Wellbeing Indicator is a proxy measure based on the Kempson *et al.* conceptual model of financial wellbeing, derived from data gathered through the weekly Roy Morgan Single Source interview and survey, which canvasses approximately 50,000 Australians annually. The breadth of data gathered through Roy Morgan Single Source enabled examination of Australians' financial wellbeing at a more granular level than was possible previously.

At the time of its launch in December 2019, we did not anticipate that the new quarterly snapshot offered by the ANZ Roy Morgan FWBI would become a litmus test for the financial wellbeing of Australians at various stages of the global pandemic. However, since the onset of COVID-19 in March 2020, it has enabled us to see that impacts on the economy and on people's lives have been significant and widespread.

THE PANDEMIC AFFECTED HOW PEOPLE FELT ABOUT THEIR FINANCIAL SITUATION, HOW THEY SPENT AND SAVED THEIR MONEY AND THEIR OVERALL FINANCIAL WELLBEING.

Financial wellbeing fell by 5.3% from March 2020 to March 2021. However, the effect on Australians' financial wellbeing was already evident in the months of April and May 2020, with the pandemic having the greatest impact on how Australians were feeling about their current and future financial situation as opposed to more objective measures of economic impact, such as 'meeting everyday commitments' and their 'resilience for the future' (Figure A). 'Feeling comfortable' recovered slightly from the initial shock, while 'meeting everyday commitments' remained at a lower level, and the pandemic had minimal impact on 'financial resilience' at the aggregate level. Individuals' ability to meet their financial commitments and ensure they have financial reserves in place,
were significantly underpinned by government support and institutional initiatives, which were put in place to help minimise the impacts of COVID-19.

Over time, the FWBI went on to show that the initial impact of COVID-19 fell disproportionately for some groups more than others. Business owners experienced a larger decline in financial wellbeing year-on-year (down 6.1%) than employees (down 5.5%) and retirees (down 5.2%). Micro business owners – businesses with less than five employees – experienced an even larger decline in financial wellbeing year-on-year, down 8.3%.

Similarly, people in some occupations were impacted differently by the pandemic as certain industries were more directly impacted by social distancing and other restrictions. Some of the occupations that experienced large declines in financial wellbeing were:

- Food trades (down 18.6%)
- Arts and media professionals (down 16.8%)
- Construction trades (down 16.5%)
- Personal assistants and secretaries (down 15.8%)
- Store persons (down 15.6%)
- Hospitality workers (down 11.9%) (Figure B).

People working in a small group of occupations experienced improvements in their financial wellbeing year-on-year, as restrictions resulted in increased demand for many of these occupations. These include:

- Farmers and farm managers (up 8.9%)
- Other labourers (up 8.8%)
- Protective service workers (up 7.4%)
- Cleaners and laundry workers (up 7.2%)
- Factory process workers (up 5.2%)
- Carers and aides (up 4.0%) (Figure B).

The ANZ Roy Morgan Financial Wellbeing Indicator will continue to monitor quarterly the ongoing effects of the pandemic, and other general and unforeseen events to come.
Financial lives in uncertain times

ANZ has been working with community partners and stakeholders to apply insights from the ANZ Roy Morgan Financial Wellbeing Indicator to address different issues facing particular groups in the community.

The Brotherhood of St. Laurence (BSL) is a social justice organisation working to prevent and alleviate poverty across Australia. Its approach is informed directly by the people experiencing disadvantage and uses evidence drawn from research, together with insights from programs and services, to develop practical solutions that work.

Through its partnership with ANZ, BSL has published a series entitled Financial Lives in Uncertain Times, examining patterns of financial wellbeing in Australia. For more information about the specific impacts of COVID-19 on different socio-economic groups in the community, see Financial lives in uncertain times | Brotherhood of St. Laurence at bsl.org.au.

Design and analysis

While the 2021 questionnaire retained consistency with previous iterations, with guidance from our Steering Committees in Australia and New Zealand, we considered a number of new issues. We aimed to ensure that any proposed new questions had a role in contributing to the further explanation of financial wellbeing, and reflected the latest evolution in thinking about what drives financial wellbeing and the way people interact with financial services today. Questions agreed to be most important for inclusion explored the impacts on financial capability and financial wellbeing of the following:

› Future financial security

› Digital capability and online scam experience

› Key life events

› Disruptors to the life-cycle such as health and mental health

› Access to social support

› A broader range of behaviour traits including frugality, optimism and goal setting

Survey procedures were designed to ensure the final sample reflected the latest Australian Bureau of Statistics (ABS) estimates of the age, gender and geographic distribution of the Australian adult population. The sample was also adjusted to control for variation in factors understood to have an influence on financial wellbeing from our 2017 analysis, such as housing tenure (renting/ not renting), education level (university degree/no university degree), household income (less than $50,000 per annum/not less than $50,000 per annum), savings and investments (less than $1,000/not less than $1,000).

3 The 'financial resilience' component measures the ability to cope with financial setbacks primarily drawing from one's own savings and is not to be confused with broader measures of financial resilience.

Updating our financial wellbeing measure

The 2017 survey included 11 questions measuring financial wellbeing and a range of additional questions about financial behaviour, psychological factors and financial knowledge and experience. Participants' responses were converted into scores (out of 100) against each of three dimensions considered to make up overall personal financial wellbeing:

Meeting everyday commitments
For example:
'How often do you run short of money for food and other regular expenses?'

Feeling comfortable
For example:
'How well do you think this statement fits you personally –
My finances allow me to do the things I want and enjoy in life.'

Financial resilience[3]
For example:
'If your income fell by a third, for how long could you meet all your expenses without needing to borrow?'

Scores for each dimension were calculated and an overall financial wellbeing score was created as an average of the dimensions.

Our 2017 survey highlighted the importance of having a strong future focus – people who focused on the long term tended to have higher levels of financial wellbeing. Similarly, people with higher financial wellbeing in 2017 tended to feel less anxious about their future in retirement. International developments since 2017 have further highlighted the importance of perceived financial wellbeing, in particular how stressed people feel about their current financial situation and their perception of their longer-term 'future security' developed by Netemeyer *et al.* (2018).

As a result of these developments, the 2021 survey included four additional questions which measure whether people were:

Feeling secure for the future
For example:
'How well does the following describe you –
I will be financially secure until the end of my life.'

Analysis showed that this was a key dimension of financial wellbeing in Australia. To reflect its importance, we have adapted our model to incorporate it as an important fourth dimension in the measure of financial wellbeing outcomes (Figure 1).

Evolution of the financial wellbeing conceptual model

The 2017 survey was designed to investigate the key drivers of financial wellbeing, drawing on the then Financial Wellbeing Conceptual Model of Kempson *et al.* The model acknowledged that four domains of influence have a proportionate impact on personal financial wellbeing:

• Social and economic environment

• Financial knowledge and experience

• Psychological factors (attitudes, motivations and biases)

• Financially capable behaviours.

The 2017 survey used regression analysis to explore the proportionate impact of each of these drivers on Australians' financial wellbeing and highlighted how behaviours were a strong determinant of financial wellbeing. However, the nature of the relationships and direction of causality between behaviours and other domains of the financial wellbeing model, were not analysed to any great degree.

Since the release of the 2017 survey results, the Kempson *et al.* model was revised following further analysis of the key drivers of financial wellbeing. Figure 2 shows the 'redrawn' Conceptual Model of Financial Wellbeing based on the above conclusions, highlighting the direct (blue) and indirect (grey) influence that eight domains (expanded from the four listed above) have on financial wellbeing.

Kempson *et al.* have also concluded that a person's level of financial confidence is most likely an outcome of their personal financial wellbeing, rather than a driver of it. This concept is shown by the 'feedback loop' (dark blue) which allows for saving, spending and investment behaviours to be reinforced or validated through improved confidence resulting from improved financial wellbeing.

The revised Kempson *et al.* model (2018) is one of the few 'large-scale' hypothetical models in the financial wellbeing literature that ties together the multitude of potential influences on financial wellbeing. The structure of the model is based on research into how the various variables interact and affect financial wellbeing (Figure 2). Kempson *et al.* (2018).[4]

The model serves a useful purpose for this research by organising the relationships between the variables that potentially influence financial wellbeing, so that each variable can be understood in terms of its role and relative influence. The directions of association between the various variables and domains with financial wellbeing, generally satisfy common sense tests on what variables are potentially precedents of, or consequences of, financial wellbeing. This has led to our use of terms such as 'influence on' or 'drivers of' the various model components.

Specifying the revised Financial Wellbeing Conceptual Model as a basis for analysis, the 2021 survey uses structural equation modelling (SEM) to analyse the network of relationships along the different paths and determine their direct and indirect influence on financial wellbeing.

Application of this model in our analysis in the Australian context is mostly consistent with Kempson *et al.* (2017), however inclusion of a fourth dimension of financial wellbeing – feeling secure for the future – in our measure has identified 'investment behaviour' as an additional financial behaviour with a direct impact on financial wellbeing (Figure 2).

A summary of the survey methodology and technical approach is included in Appendix B and C (page 46).

FIGURE 1 MOVING FROM THREE TO FOUR DIMENSIONS OF FINANCIAL WELLBEING

MEETING EVERYDAY COMMITMENTS

KEY FINDINGS

01

Through an updated modelling approach, we have a better understanding of how a person's socio-economic context and their behaviour traits are key to financial wellbeing.

The 2017 survey was the first application of the Financial Wellbeing Conceptual Model developed by Kempson *et al*. in Australia and New Zealand. The proportionate impact of each of the key drivers on financial wellbeing was determined using a regression analysis. This analysis assumed that each of the variables driving financial wellbeing worked independently in their impact on financial wellbeing. However, the 2017 analysis acknowledged that there was likely to be interaction between those variables. For example, while a person's social and economic environment impacted financial wellbeing directly, it was also likely to do so indirectly through an individual's knowledge and experience, attitudes and behaviours.

The revised pathways model used in 2021 highlights both the direct and indirect effects of the different drivers on financial wellbeing (Figure 2). The use of structural equation modelling (SEM) in 2021 has provided an opportunity to quantify how much influence the various factors have on financial wellbeing given the model structure, including causal directions hypothesised by the Kempson model. For example, our 2017 analysis highlighted that financial behaviours accounted for 45% of overall financial wellbeing. However, some of this influence was due to other factors such as socio-economics, attitudes and confidence working through behaviours.
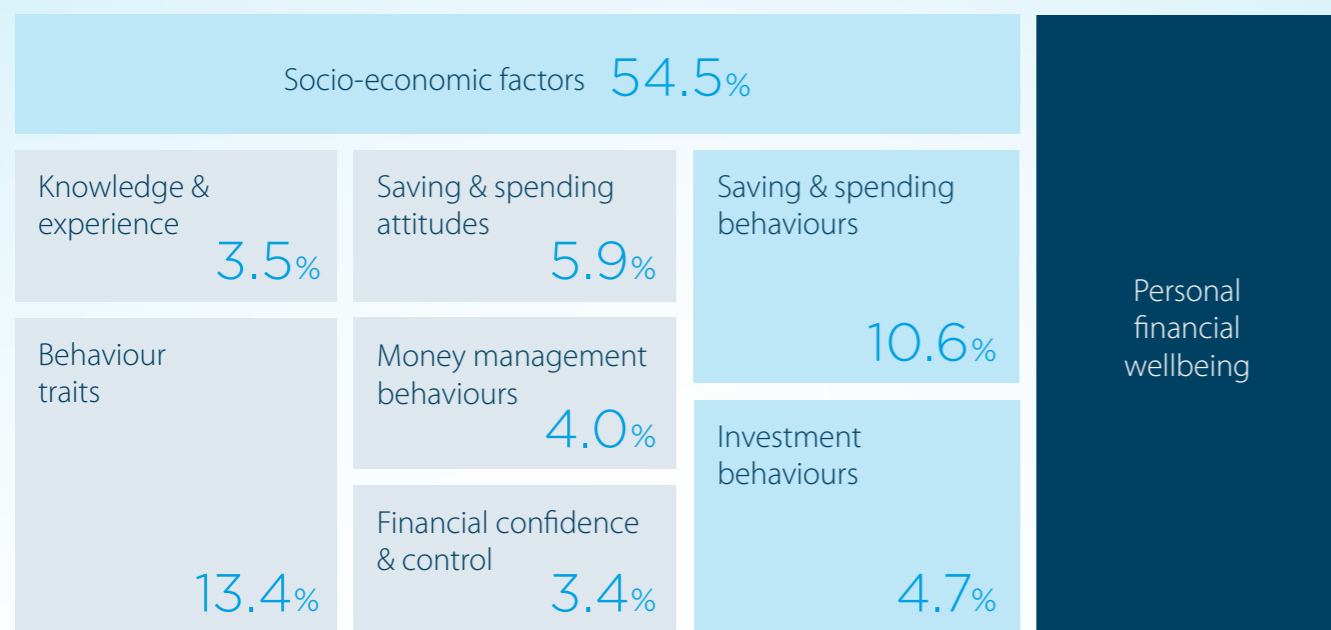

Figure 3 shows the isolated influence or 'value added' of each of the main drivers. What becomes clear from the analysis is the importance of a person's context, both in terms of their socio-economic status and their behaviour traits.

THE TOTAL IMPACT OF SOCIO-ECONOMIC FACTORS AND LIFE EVENTS ON FINANCIAL WELLBEING WERE SUBSTANTIALLY HIGHER THAN OUR PREVIOUS ANALYSIS WAS ABLE TO DEMONSTRATE.

Socio-economic factors accounted for 54.5% of the explained variation[5] in overall financial wellbeing, while behaviour traits such as a person's orientation towards the future, impulsivity, optimism or frugality accounted for 13.4%.[6]

Financial behaviours such as saving and spending behaviours, investment behaviours and money management behaviours, still accounted for 19.3% of the explained variation in financial wellbeing in the 2021 survey (Figure 3).

FIGURE 3 INFLUENCES ON FINANCIAL WELLBEING

Socio-economic factors	54.5%
Knowledge & experience 3.5%	Saving & spending attitudes 5.9%	Saving & spending behaviours 10.6%	Personal financial wellbeing
Behaviour traits 13.4%	Money management behaviours 4.0% / Financial confidence & control 3.4%	Investment behaviours 4.7%	

5 Overall, the structural equation model developed was able to explain 75% of the variation in people's financial wellbeing scores.
6 The influence of each main driver on financial wellbeing is represented by the percentage shown next to it. These percentages were obtained by summing the standardised total effects of the components of each driver and rescaling each component to a percentage based on this overall sum. The total effect for each endogenous component (i.e. all those in Figure 2 other than the socio-economic factors, behaviour traits and personal financial wellbeing) was adjusted to allow for the proportion explained by those exogenous components (i.e. the socio-economic factors and behaviour traits) which impacted directly upon it.

02

We have updated our financial wellbeing measure to include 'feeling secure for the future.'

64
out of 100
The average financial wellbeing score for respondents in Australia was 64 (out of 100). However, we know that financial wellbeing is not evenly spread across the population. We revisited the financial wellbeing categories identified in our 2018 ANZ Financial Wellbeing Survey Report, where respondents were divided into four segments according to their financial wellbeing score (out of 100):

- The bottom 11% were considered **struggling** (financial wellbeing score 0-30)
- 17% were **getting by** (financial wellbeing score >30-50)
- 43% were **doing OK** (financial wellbeing score >50-80)
- The top 29% were considered to have **no worries** (financial wellbeing score >80-100) page 14–15

PEOPLE WHO WERE **STRUGGLING** RECORDED THE LOWEST SCORES ACROSS ALL FOUR COMPONENTS OF FINANCIAL WELLBEING, WHEREAS PEOPLE WHO HAD **NO WORRIES** RECORDED THE HIGHEST SCORES
The survey included four additional questions about 'feeling secure for the future':

1. *I am becoming financially secure*
2. *I will be financially secure until the end of my life*
3. *I am securing my financial future*
4. *I have saved (or will be able to save) enough money to last me to the end of my life*[7]

Analysis showed that the score for 'feeling secure for the future' was an important fourth component of overall personal financial wellbeing. Having a future focus is critically important for financial security today and in later life and increases the likelihood of undertaking behaviours to plan for retirement. The inclusion of 'feeling secure for the future' provides a longer-term view of financial wellbeing outcomes.

In many countries, governments struggle convincing people to adequately plan for their retirement (Eberhardt *et al*., 2021). Even in countries with mandatory retirement savings such as Australia, many find it difficult to envision their 'future selves' and plan enough savings for retirement. For instance, 32% of survey respondents did not think that they had saved (or would be able to save) enough money to last to the end of their life.[8]

FIGURE 4 FINANCIAL WELLBEING BY COMPONENT IN THE AUSTRALIAN POPULATION SCORE (OUT OF 100)

	Struggling	Getting by	Doing OK	No worries
Overall financial wellbeing	19	41	66	90
Meeting commitments	36	58	81	98
Feeling comfortable	22	42	65	89
Financial resilience	9	32	64	92
Feeling secure for the future	13	36	57	84

7 Netemeyer, R. G. *et al.* (2018).
8 It is important to note that the four-component financial wellbeing construct is not directly comparable with the three-component measure used in 2017. However, as well as providing a more comprehensive view of financial wellbeing, the four-component construct also provides a slightly better unidimensional scale for measuring financial wellbeing with Cronbach's alpha improving from 0.92 to 0.94.

HOW ARE AUSTRALIANS FARING?

FINANCIAL WELLBEING IN THE AUSTRALIAN POPULATION

NO WORRIES	29%

People in the **no worries** group had an average financial wellbeing score of 90 out of 100. They were generally wealthier and much more likely to consider their current financial situation in a positive light with 97% describing it as very or somewhat good, compared with 59% of people **doing OK,** 14% of those **getting by** and 2% of people who were **struggling**. People in the **no worries** group were also much more positive about their financial future with 86% feeling they will be financially secure until the end of their life.

- Over two-fifths (44%) of this group earned over $100,000 per annum (compared to 32% of all respondents) and had high levels of savings (61% had more than $50,000 in savings). They were more likely to invest than other groups, hold superannuation (61%), a self-managed super fund (15%), a share portfolio (35%) or investment property financed with or without a loan/mortgage (17% and 11% respectively). They were also more likely to seek guidance from an accountant (29%) or financial advisor (29%) and less likely to go to informal sources such as parents, relatives and friends.

- Age was a strong demographic factor with 65% over 50 years old (39% over 65 years). As such, they were much more likely to be retired (34% compared to 18% for all respondents) and while the main source of income was wages/salary for 50% of people in the **no worries** group, they were more likely to source their income from superannuation/self-funded retirement income (30% compared to 13% for all respondents). Many were living with a partner and no children (48%).

- Even though people in this group were generally older, they were less likely on average to report poor physical or mental health – 42% reported having excellent/very good physical health and 57% reported having excellent/very good mental health. They were also more likely to feel they could definitely call on family members for support if they needed it (49% compared to 37% of all respondents).

- People in the **no worries** group were generally more 'forward looking' with above average scores for future orientation, optimism and goal orientation. They also demonstrated higher levels of self-control and frugality and lower levels of impulsivity.

DOING OK	43%

Most Australians (43%) were **doing OK** with an average financial wellbeing score of 66 out of 100. While most people **doing OK** said they could meet their bills and credit card commitments without any difficulty (55%), 37% said it was a struggle from time to time.

- The **doing OK** group were more likely to budget or plan, with 62% reporting that they often or sometimes kept a plan for how they spent their income. They were also more likely to have their savings put aside automatically than the general population (33%), use different accounts for different spending or saving ('bucketing') (56%) or use budgeting tools to achieve saving or investment goals (22%).

- Their feelings about their future security was on par with the average for all respondents. The **doing OK** group were much more likely to strongly or somewhat agree to feeling anxious when they think about their future financial situation (43%) than the **no worries** group. Almost half (48%) had superannuation, on par with the average for all respondents.

- People **doing OK** demonstrated less future or action orientation and were more impulsive than the **no worries** group. Their scores for goal orientation, optimism and frugality were in line with the national average.

- People **doing OK** were more likely to own their own home with a mortgage (38%), with 18% using a mortgage offset account. One-fifth (21%) of mortgage holders **doing OK** always or often make higher repayments. This group were generally okay when it came to ease of paying their mortgage/rent with 38% finding it somewhat easy or neither easy nor difficult to make their mortgage payments.

- The **doing OK** group were more likely to be employed full time (44%). Almost half (45%) were classified as 'older families', with 28% aged between 35 and 49 years. This group generally reported their physical health and mental health as 'good' (47% and 42% respectively).

GETTING BY	17%

Australians who were just **getting by** had an average financial wellbeing score of 41 out of 100. While still higher than the **struggling** group, this group recorded below average scores for all four components of financial wellbeing.

- People who were **getting by** were less likely to hold term deposit accounts (5%) and savings accounts with bonus interest (26%) than the general population (33%). They were also more likely to have a personal or car loan from a financial institution (20%) or use buy now pay later schemes (33%). Of the people **getting by** who used buy now pay later schemes, 6% reported being unable to make a scheduled payment at least once per year while a further 6% could not make a payment either several times a year or most months. People **getting by** also had lower than average ownership of home and contents insurance (35%) and car insurance (52%).

- Most were living with a spouse/partner with children (28%). They were less likely to be living with a spouse without children (18%) than the general population (31%) and twice as likely to be living with parent(s) (15%). Young adults aged 18-24 years were over-represented in this group and 36% of people **getting by** sought information, guidance or support from their parents.

- While most people **getting by** were employed full-time (31%), part-time workers were over-represented in this group (21% of people **getting by**). Their main source of income was wages or salary (56%) with a further 30% sourcing most of their income from a government benefit or allowance. Close to half (46%) reported that their income, while generally predictable, could vary a little month-to-month, with a further 18% reporting that their income could vary a lot. The highest education level attained for most people in this group was a technical certificate (TAFE) or diploma (29%). They were less likely than the general population to have a tertiary degree qualification (17% compared to 26%).

- The **getting by** group was also more likely to have a long-term health condition than the national average (32%). They mostly described their physical health as good (43%) or fair (33%) but 46% described their mental health as fair or poor.

- Almost two-thirds (63%) of people **getting by** felt anxious when they thought about their future financial situation (strongly or somewhat agree). They were also less likely to invest and only 34% reported having superannuation.

- People **getting by** were less future oriented, less optimistic or goal orientated than people with higher levels of financial wellbeing. They also exhibited lower levels of self-control and action orientation and were more impulsive. People **getting by** recorded the lowest levels of frugality amongst all segments.

STRUGGLING	11%

People who were **struggling** had the lowest average financial wellbeing score of 19 out of 100. Most described their current financial situation as somewhat bad (50%) or very bad (28%) but were much less likely to have sought information, guidance or support with finances from formal sources in the last 12 months. Three-quarters (76%) said they rarely or never had money left over after food and other regular expenses.

- Members of this group were less likely to be employed full-time (18% compared to 37% of respondents) and more likely to be looking for work. They were half as likely as the general population to be degree qualified (14%). Their household income was mostly under $35,000 per year (49%) with the main source of income a government benefit or allowance for 46% of people in this group. Almost one-quarter (22%) of people **struggling** reported their income varied considerably from month-to-month.

- They were more likely than the general population to be aged 25-34 years old (26%), women (60%), divorced (44% – more than half in the last 10 years), single parents (18%), renting (65%), living in a shared household (11%) or living with a child/extended family as an adult (6%). They were more likely to report poor physical (16%) and mental (32%) health, with 46% suffering a long-term health condition, impairment or disability.

- **Struggling** Australians were more likely to have a personal or car loan from a financial institution (21%), payday loan (18% borrowed at least once per year) or borrow from family or friends (18%). Two-fifths (41%) used buy now pay later schemes (compared to 20% of respondents), with 16% unable to make a scheduled payment several times a year or most months.

- Three-quarters (73%) reported not having any savings and 82% would not be able to fund an unexpected expense equivalent to a month's income from money in their bank account. This group was much less likely than the general population to hold a separate account for saving, including a regular interest bearing account (32% versus 41%), a bonus interest account (20% versus 33%) or term deposit (1% versus 11%). They were also much less likely to hold home and contents insurance (33%) or car insurance (49%) than the general population (58% and 68% respectively).

- Eighty-six per cent strongly or somewhat agreed to feeling anxious about their future financial situation (with 64% strongly agreeing). Two-thirds (66%) reported not having any superannuation. They were less likely to own a home with or without a mortgage (27%) and 43% did not think owning a home was a realistic goal for them.

- People who were **struggling** were much less likely to feel optimistic or be future-oriented. They were not strongly goal or action-oriented but demonstrated frugality in line with the national average.

03

Socio-economic factors and the effects of life's ups and downs had the greatest influence on financial wellbeing, with health, unemployment and earning potential the most significant.

In 2017, we were able to demonstrate the direct impact of socio-economic factors on overall financial wellbeing. However, the research acknowledged that the interaction between different socio-economic factors and their simultaneous effects on attitudes, financial confidence and behaviours were unable to be quantified using the 2017 methodology. Through structural equation modelling (SEM), the 2021 research has been able to better explain the effects of a number of defined independent socio-economic

variables that could potentially act as significant 'enablers' and 'blockers' of financial wellbeing. These socio-economic factors accounted for 54.5% of the explained variation in overall financial wellbeing score. Each of the socio-economic variables shown in Figure 5 had a different influence on financial wellbeing, with 'earning potential' having the highest positive contribution to financial wellbeing and 'health concerns' the highest negative contribution.

FIGURE 5 IMPACT OF SOCIO-ECONOMIC CONDITIONS ON FINANCIAL WELLBEING (%)
A. Impact of health concerns

Our research showed that experiencing poor physical and/or mental health is one of the most significant potential disruptors of financial wellbeing. In fact, it had a larger impact on personal financial wellbeing than an individual's saving and spending behaviours, accounting for 13.7%[9] of the overall financial wellbeing score. This suggests that even if someone is doing everything right – actively saving, not borrowing for everyday expenses and exercising spending restraint – a major health event can disrupt the impact of those behaviours on financial wellbeing.

Whether a person reported their physical or mental health as fair or poor was strongly correlated with their financial wellbeing. Twenty-eight per cent of Australians reported their mental health as fair or poor, rising to much higher levels for people with low financial wellbeing, with 46% of people **getting by** and 68% of people **struggling** stating that their mental health was fair or poor. Similarly, 27% of Australians reported having fair or poor physical health. This increased to 39% of people **getting by** and 57% of people **struggling** (Figure 6).

FIGURE 6 MENTAL AND PHYSICAL HEALTH IS FAIR OR POOR (%)

Another key component of the impact of overall health concerns on financial wellbeing is whether someone has experienced a disruptive health event. While 8% of Australians had experienced an illness in the last 12 months which disrupted their ability to work, this rose to 10% of people **getting by** and 22% of people who were **struggling**. This was also more common for people who were renters (12%), people with less than $1,000 in savings (18%), people who sought advice from a financial counsellor (18%) and people who had a payday loan (23%).

Income support is key for people who have suffered a disruptive health event with many experiencing an increase in household expenditure as a result of increased health costs. Of the Australians who had experienced an illness in the last 12 months, 41% found that their household expenditure had increased a little or substantially compared to 35% of those who had not experienced time off work as a result of illness. More than a third (35%) were receiving a government benefit or allowance compared to 18% of those who had not experienced time off work as a result of illness. More than half (53%) reported a decrease in household income during the last 12 months (compared to 27% of those not experiencing an illness and unable to work) and 25% were either 'looking for work' or 'not working and not looking for work'.

This group was also characterised by low financial wellbeing (mean score of 45 out of 100) and 34% were **struggling**. Time off work as a result of illness was also more likely to impact older workers with 32% of people experiencing a disruptive health event aged 50-64 years in this group compared to 22% aged 50-64 years for those who had not.

B. Unemployment

Unemployment had the second largest socio-economic impact, acting as a significant disruptor to a person's financial wellbeing. The key elements demonstrating the effects of unemployment were whether there had been a change in household income, loss of job or redundancy in the last 12 months and whether a person was looking for work.

It is highly likely that the pandemic had an impact on responses to these elements, particularly for people with lower levels of financial wellbeing who may have been unable to work remotely or who worked in industries directly impacted by restrictions. Research by the Brotherhood of St Laurence – **Financial Lives in Uncertain Times** – examines the impacts of the pandemic on the financial wellbeing of the unemployed and people on low incomes, highlighting the important role played by additional government support.[10]

While 10% of Australians reported their income had decreased substantially in the last 12 months, this was much higher for people who were **struggling** (32%) and **getting by** (14%) (Figure 7). People who were **struggling** were also more likely to have been impacted by job loss or redundancy in the last 12 months during the pandemic. While 10% of Australians reported experiencing a job loss or redundancy, 27% of people who were **struggling** and 17% of people **getting by** had reported losing a job.

FIGURE 7 INCOME DECREASED SUBSTANTIALLY IN THE LAST 12 MONTHS/EXPERIENCE OF A JOB LOSS OR REDUNDANCY IN THE LAST 12 MONTHS (%)

C. Earning potential

A person's earning potential encompasses those key elements that contribute to an individual's ability to earn a higher income. These include their level of post-secondary education, whether they are a professional or senior manager, their 'blue collar/white collar' status and their household income. Earning potential was the largest socio-economic 'enabler' of financial wellbeing.

WHILE HOUSEHOLD INCOME WAS POSITIVELY CORRELATED WITH FINANCIAL WELLBEING (FIGURE 8), AN INDIVIDUAL'S LEVEL OF POST-SECONDARY EDUCATION WAS THE LARGEST CONTRIBUTOR TO THEIR EARNING POTENTIAL SCORE.

FIGURE 8 FINANCIAL WELLBEING BY INCOME SCORE (OUT OF 100)

---

9   These figures have been calculated using the standardised total effect coefficient of each socio-economic component on financial wellbeing expressed as a fraction of the sum of all eight socio-economic conditions. For each, that fraction was multiplied by the total 54.5% contribution that all the socio-economic components make to the explanation of financial wellbeing.

10 For more information, see the Brotherhood of St Laurence *Financial lives in uncertain times* series at bsl.org.au.

Australians with no post-secondary qualifications had below average financial wellbeing scores (59 out of 100) (Figure 9). Additional levels of qualifications contributed to an individual's earning potential and, as a result, their financial wellbeing. Achieving an undergraduate certificate or diploma added seven points to an individual's financial wellbeing score post year 12. Similarly, completing a trade or apprenticeship improved financial wellbeing by nine points and completing a university degree improved financial wellbeing by 12 points over year 12 achievement alone (Figure 9).

58
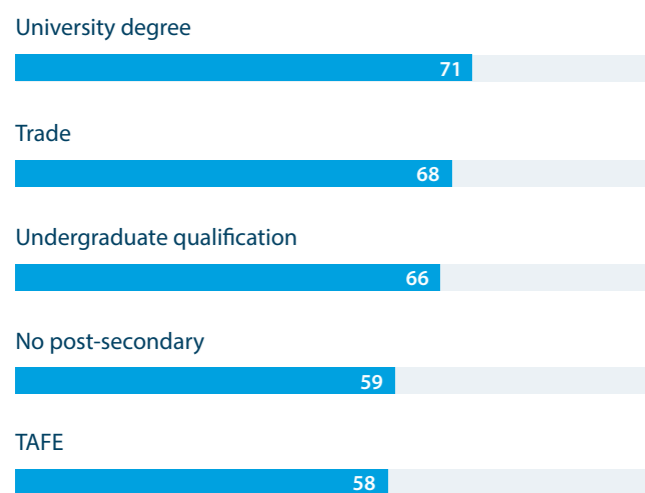

An individual's earning potential score generally improves with their working age. The earning potential score was highest for people classified as 'older families' (people over 40 still working) at 52 out of 100 and lowest for 'young adults' (single under 40, no children) at 46 out of 100.

D. Life journey

The impact of life journey on financial wellbeing is reinforced in the 2021 survey as having the second largest positive socio-economic impact on financial wellbeing. Key elements of a life journey – whether a person is retired, their age, if they are in receipt of a government aged pension and whether they find it easy to pay their mortgage or rent – have a strong positive impact on financial wellbeing.

In 2018, ANZ's research into **Financial Wellbeing: Older Australians** highlighted the strong positive correlation between age and financial wellbeing. Older Australians generally had higher financial wellbeing than younger people and were less likely to be **struggling** financially compared to other groups.[11] They were less likely to borrow for everyday expenses, had high levels of confidence in money management, higher levels of home ownership and more stable incomes.

As people progress through life, they usually have some opportunity to improve their financial wellbeing through accumulating savings and wealth over time.

As earnings also tend to improve with time spent in full-time work, the potential exists for these two things to be mutually reinforcing, at least until people retire.

Figure 10 shows Australians at different stages in their life journey. Notably, fully retired Australians over 65 years of age had much higher average financial wellbeing than all other groups. Older families (all people aged 40-64 years with or without children and over 65 years who are still working) had financial wellbeing in line with the national average. Whereas young adults under 40 years of age (not married/de facto and are not parents) and young families with adults under 40 years (married/de facto, with or without children, or single parents) had the lowest level of financial wellbeing of 59 out of 100 and 58 out of 100 respectively.

FIGURE 10 FINANCIAL WELLBEING BY LIFE STAGE SCORE (OUT OF 100)

Australia average (64)

| Young adults	Young families	Older families	Retirees
59	58	64	77
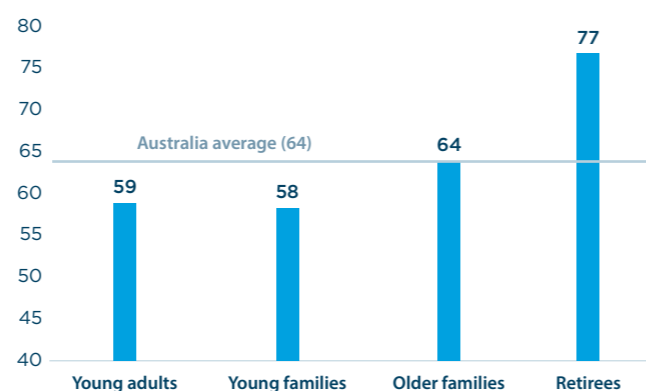

People who owned their home outright had higher financial wellbeing scores on average (78 out of 100) compared to those who owned a home with a mortgage (66 out of 100) and those who were renting (49 out of 100). However, rather than just considering whether a person owned their own home outright or not, the research showed that a key driver of the impact of life stage was the affordability of repayments – whether someone was finding it easy or difficult to pay their mortgage or rent. On the whole, 9% of Australians were finding it either very or somewhat difficult to pay their mortgage or rent. People who were **struggling** were finding it particularly difficult to cover their housing costs, with 38% reporting that it was either very or somewhat difficult to pay their mortgage or rent. A further 16% of people **getting by** were finding it difficult to cover these expenses.

Housing affordability has been an increasing issue for younger Australians. On the whole, 15% of Australians wanted to own a home but did not think it was a realistic goal for them (Figure 11). This was higher for younger Australians with 20% of people aged 18 to 24 years not believing home ownership was a realistic goal and 19% of 25-to-34 year-olds feeling the same way.

The goal of home ownership was also less realistic for many with lower levels of financial wellbeing. Two-fifths (43%) of people **struggling** and 24% of people **getting by** responded that they would like to own a home but felt that it was not a realistic goal for them.

FIGURE 11 'OWNING A HOME IS NOT A REALISTIC GOAL FOR ME' (%)

| Total population	18-24	25-34	35-49	50-64	65+
15	20	19	15	15	10
E. Importance of social supports

The research showed that having access to social support networks was important to enable financial wellbeing. Access to social support networks included whether a person could seek any kind of support from family, friends or their broader community, whether their parents talked to them about finances growing up, or whether they may have received a significant inheritance in the last 12 months.

People who were **struggling** were more likely to feel they had no support from family, friends and the broader community. Figure 12 shows that 30% of people **struggling** felt they could not access support from family if they needed it; only 18% of the general population felt similarly. Likewise, the majority of people **struggling** (55%) and 44% of people **getting by** felt they could not seek support from friends if needed. Most Australians either did not think that support would be available to them from neighbours or their local community (59%) or did not know if they would be able to access support (23%).
In the last 12 months during the pandemic, Australians used a number of different sources for information, guidance or support with their finances, both formal and informal. More than one-fifth (22%) had been to an accountant, 18% had been to a financial planner, 16% and 14% had been to a bank website or bank employee respectively. Three per cent had sought information, guidance or support from a financial counsellor. More than two-fifths (43%) had not sought information, guidance or support from formal sources in the last 12 months.

One-quarter (25%) of respondents had sought information, guidance or support from their parents in the last 12 months, 22% from close friends and 15% from close relatives. Almost one-fifth (18%) had used an online resource (such as a website, blog, webinar or podcast).

People in the **no worries** group were more likely to speak to an accountant (29%) or financial planner (29%) than the national average, whereas people who were **struggling** or **getting by** were more likely to seek informal support from parents (31% and 36% respectively). Almost two-thirds (62%) of people **struggling** reported that they did not seek any information, guidance or support with their finances from formal sources in the last 12 months during the pandemic.

Having money conversations remained an important part of social support and financial wellbeing. Whether parents had provided advice growing up was strongly correlated with financial wellbeing. One-third (32%) of Australians reported that their parents had discussed how to manage finances when they were growing up. Sixteen per cent of people who were **struggling** said that their parents had discussed finances with them when they were growing up, compared to 22% for people **getting by**, 33% of people **doing OK** and 40% of people in the **no worries** group.

Australians with higher financial wellbeing were also more comfortable having money conversations with people in their close circle of family and friends. They were also more comfortable talking to their main bank and utility providers. Only around a third of people **struggling** were comfortable talking about their financial situation with their main bank or utility provider.

● From family members   ● From friends

## F. Need for financial stability

In 2017, our research showed that low levels of income variability correlated with higher levels of financial wellbeing. Our updated understanding of financial stability showed that low income variability works together with levels of consumer debt (less than $1,000) to positively influence financial wellbeing. While financial stability influences financial wellbeing directly, it also affects people's attitudes to saving and spending and to a lesser extent financial confidence, both of which have a strong impact on financial behaviours.

People with lower levels of financial wellbeing were less likely to report that their household income was predictable month-to-month. Thirty-five per cent of people **struggling** and 36% of people **getting by** said that their income was very predictable. This compared to 50% of people **doing OK** and 63% of people in the **no worries** group stating that their income was very predictable from month-to-month.

The research found that it does not take a lot of consumer debt to negatively affect financial wellbeing. Notably people with low levels of consumer debt (under $1,000) have much higher than average financial wellbeing scores. Financial wellbeing begins to fall below the national average, even with consumer debt between $1,000 and $5,000. The mean financial wellbeing score fell further for people holding more than $5,000 in consumer debt (Figure 13).
G. Influence of gender and supporting children

While not as strong an effect as other socio-economic factors, gender and supporting children had a significant influence on an individual's financial wellbeing score. Men generally had higher financial wellbeing scores than women, with an average score of 66 (out of 100) compared to 62 (out of 100). This gap has remained consistent since our 2017 research. Women were much more likely to be **struggling** (60% of people **struggling** were female) whereas men were more likely than average to be in the **no worries** group (57% were male).

Men generally scored above average on all four components of financial wellbeing whereas women scored below average for whether they were feeling comfortable about their financial situation, their financial resilience and their security for the future (Figure 14). While there was not a significant difference between the saving and spending behaviours of men and women, men generally demonstrated stronger investment behaviours, with 29% making sure they had money available for investment purposes compared to 23% of women. Men were also more likely to have share portfolios (22% compared to 14% of women) and 22% reported having used a budgeting tool to help achieve savings or investment goals in the last 12 months, compared to 17% of women. Men were also more likely to report that they understood the risks associated with margin loans well or very well (28% compared to 15% of women) and investing in the share market (51% compared to 34% of women). Women were more likely to use buy now pay later schemes than men (23% compared to 17% of men).
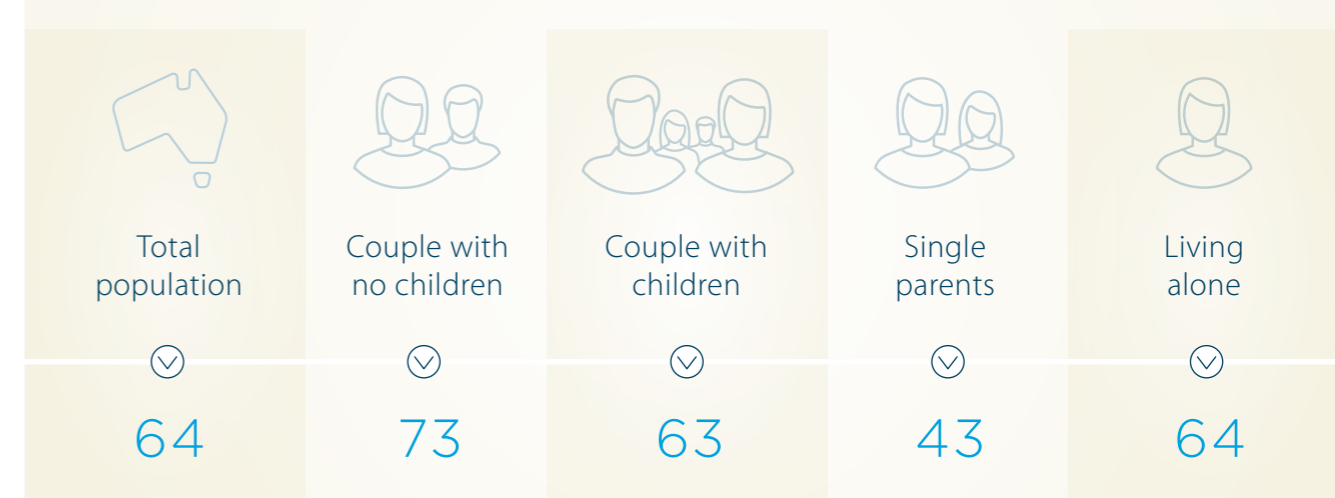

Women tended to report slightly lower scores for financial confidence and control than men but their attitude to saving and spending leaned towards more of a savings mindset, with men more likely to be spenders. Fifty-four per cent of women said they made sure there is money available for unexpected expenses or emergencies (describes me well/very well) compared to 49% of men.

Men recorded higher overall financial knowledge scores, including product risk and online risk. Men were more likely to say they understand how to protect their security online (76% say this describes me well/very well versus 72% for females) but they were also more likely to have personally lost money in a scam or fraud (16% versus 12%).

While there was not a lot of difference between men and women in their behaviour traits, men were slightly more likely to be action-oriented and reported higher self-control.

Supporting children had an influence on financial wellbeing, albeit the smallest out of our demographic variables, combining whether someone was a single parent, the number of children they were supporting and whether they were providing financial support to an adult child. Single parents had lower financial wellbeing (43 out of 100) than couples with children (63 out of 100) but both were lower than people living alone (64 out of 100) and couples without children (73 out of 100) (Figure 15).

04

Behaviours have an impact on financial wellbeing and a role to play in building resilience against life's ups and downs.

Our research showed that financial behaviours continue to have a major impact on financial wellbeing. A key finding of our 2017 research was that financial behaviours, in particular active savings and not borrowing for everyday expenses, were the strongest contributors to financial wellbeing. While our updated analysis has developed a clearer picture of the impact of socio-economic conditions, financial behaviours still have a very important role to play in financial wellbeing and are key to ensuring we have the financial resilience to lessen the impact of socio-economic disruptions. For the analysis, financial behaviours were grouped into three different categories:
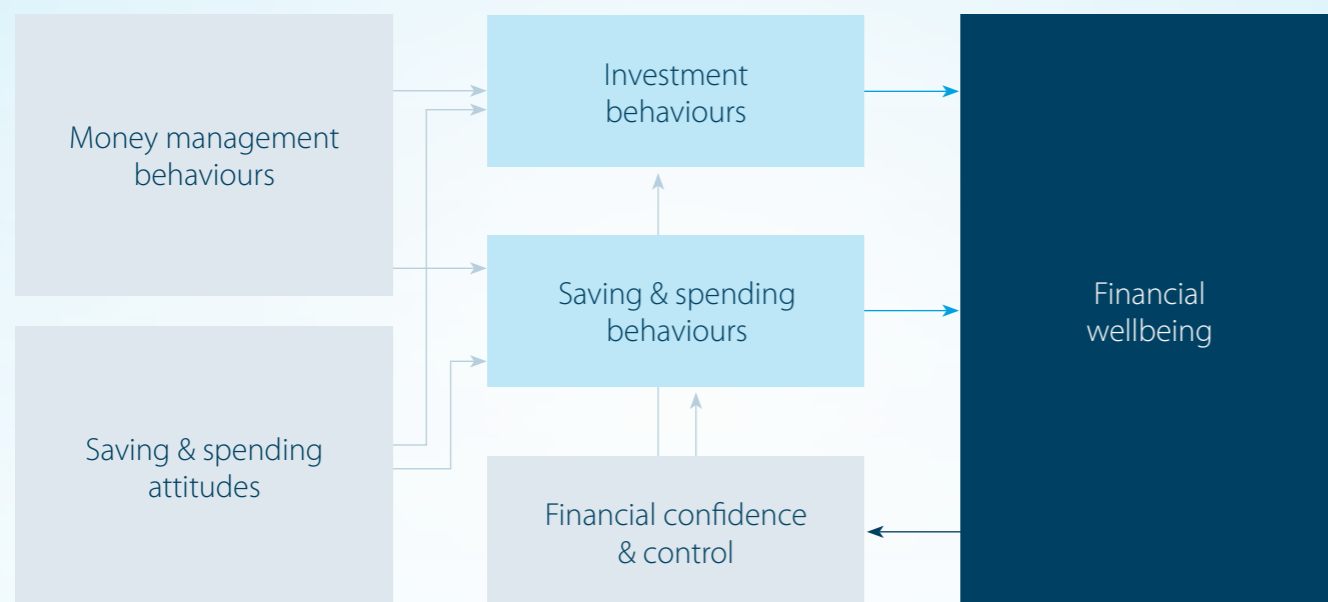

- Saving and spending behaviours such as active savings, not borrowing for everyday expenses and spending restraint
- Investment behaviours and
- Money management behaviours such as monitoring finances, planning and budgeting, and informed product choice and decision-making.

Saving and spending behaviours and investment behaviours both influenced financial wellbeing directly, whereas money management behaviours influenced financial wellbeing indirectly through driving saving, spending and investment behaviours (Figure 16).

"THE REVISED KEMPSON MODEL OF FINANCIAL WELLBEING IS A BETTER AND MORE EXPLANATORY PICTURE OF WHAT AFFECTS FINANCIAL WELLBEING."

A. Saving and spending behaviours were the most important behaviours to improve financial wellbeing

Saving and spending behaviours were by far the largest behavioural influence on financial wellbeing. The structural equation modelling approach was able to isolate the 'value-add' effect of saving and spending behaviours, which accounted for an additional 10.6% of the explained variation in overall financial wellbeing. The strongest direct effects on saving and spending behaviours were found in people's attitudes to saving and spending – whether you are more of a spender or saver – this accounted for 46% of the variation explained by factors with a direct influence on saving and spending behaviour. Additional to this, their sense of financial confidence and control over their financial lives (30%) and their money management behaviours (24%) also influenced saving and spending behaviour. As shown earlier in Figure 2, a person's behaviour traits, socio-economic situation and financial knowledge indirectly affect saving and spending behaviours through their attitudes, financial confidence and control, and money management behaviours.

Figure 17 shows that people with higher levels of financial wellbeing (**no worries**) had higher scores for saving and spending behaviours (combined active saving, not borrowing for everyday expenses and spending restraint) than people with lower levels of financial wellbeing (**struggling**). They were also more likely to regularly save money, even if it is only a small amount (89%) than the general population (71%) and people who were **struggling** (39%).

Almost one-fifth of Australians (19%) said they sometimes, often or always need to borrow money or go into debt to pay for food or expenses because they ran short of money. No one with the highest financial wellbeing (**no worries**) reported this as their experience while 12% of people who were **doing OK** and 34% of people **getting by** had to borrow or go into debt to pay for food or other expenses because they ran short of money. Most concerning, 70% of people who were **struggling** sometimes, often or always ran short of money and need to borrow to cover essentials.

People in the **no worries** group were also more likely to exercise spending restraint. While 13% of Australians said they ran short of money because they overspend (describes me well/very well),

2% of the **no worries** group responded that this described them well or very well compared to 14% of people **doing OK**, 22% of people **getting by** and 23% of people **struggling**.

B. Investment behaviours had a direct influence on financial wellbeing, particularly for those with higher financial knowledge

The inclusion of a longer-term dimension – 'feeling secure for the future' – in the measure of overall financial wellbeing has highlighted how investment behaviours have a role to play in driving financial wellbeing. Investment behaviours focus on the accumulation of longer term assets such as:

- Investing in property
- Using investment or margin loans
- Having a managed fund or share portfolio
- Planning one's finances to make sure there is money available for investment purposes.

Investment behaviours contributed 4.7% to the explained variation in overall financial wellbeing. Whether a person exhibited strong Investment behaviours was directly influenced primarily by their level of financial confidence and control over their financial lives (accounting for 79% of the variation explained by factors with a direct influence on investment behaviour) and to a lesser extent, whether they were demonstrating informed product choice and decision-making (21%). In turn, both of these factors were influenced primarily by a person's level of financial knowledge.

People with strong investment behaviours were mostly at the higher levels of financial wellbeing (**no worries**). They were much more likely to have high incomes (over $150,000 p.a.), a university degree or diploma, to be older families or retirees, male, running their own business or have no mortgage.

Australian's generally invest later in life after they have had time to accumulate savings and wealth. Older families and retirees were much more likely to perform investment behaviours, with investment behaviours scores around double that of younger adults and families.

FIGURE 17 SAVING AND SPENDING BEHAVIOUR MEAN SCORES (OUT OF 100)

Active saving   Not borrowing for everyday expenses   Spending restraint

Struggling **49**

Getting by **63**

Doing OK **77**

No worries **92**

C. Money Management Behaviours – budgeting, planning and monitoring – impact financial wellbeing through other financial behaviours

Money management behaviours such as planning and budgeting, monitoring finances, informed product choice and decision-making influence financial wellbeing indirectly through other financial behaviours, driving how people save, spend, borrow for everyday and invest their money for the long term (Figure 18). Money management behaviours alone accounted for 4% of the explained variation in overall financial wellbeing.

**FIGURE 18** MONEY MANAGEMENT BEHAVIOUR PATHWAYS TO FINANCIAL WELLBEING
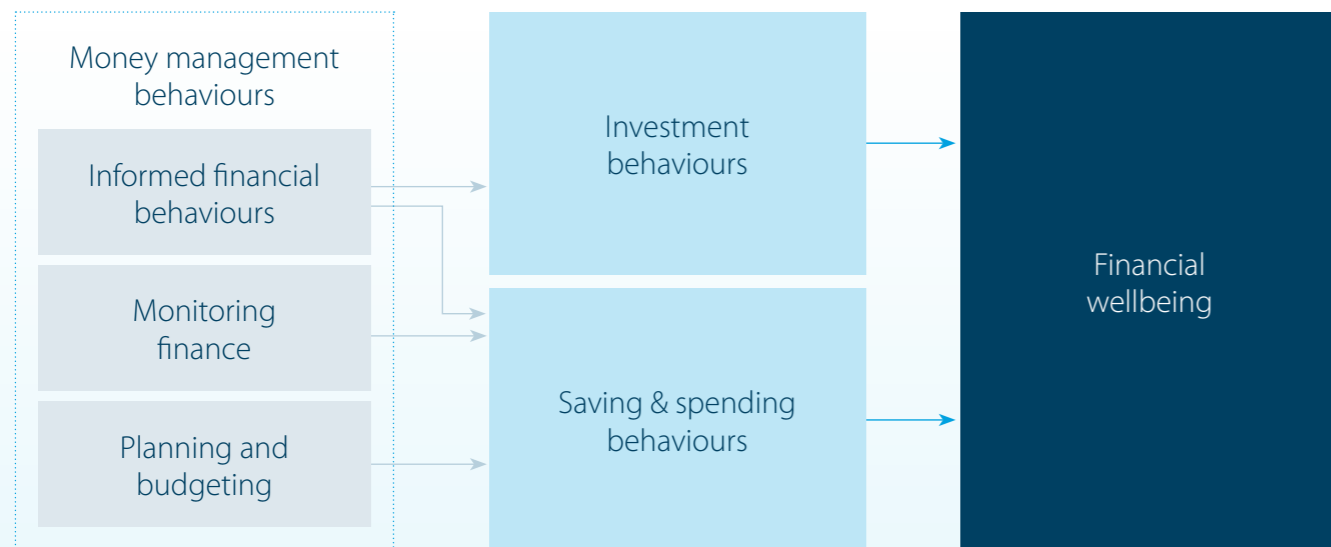

There was a strong relationship between financial wellbeing and whether someone demonstrated planning and budgeting behaviours or informed financial behaviours (informed product choice and informed decision-making). People who were **struggling** had lower average scores for planning and budgeting behaviours and informed financial behaviours than people with higher levels of financial wellbeing (Figure 19). Whether a person was regularly monitoring their finances did not have an impact on their financial wellbeing (Figure 19). It may well be that people monitor their finances when their resources are tight or perhaps see limited need when they know they have sufficient funds to cover expenses. Equally, the ease of access to accounts today may also influence these behaviours with apps on our phone that can be accessed with a simple click. Younger people (18-34 years) were more likely to track spending and saving everyday through an online tool than average. Overall, 11% of Australians track spending/saving through an online tool everyday.

Psychology plays a strong role in whether someone exhibits strong planning and budgeting behaviours or regularly monitors their finances. Planning and budgeting is most strongly influenced by a number of key behaviour traits, in particular whether someone is keen on setting goals, is thinking more about the future and is generally frugal with their money. Being goal-oriented is also the primary influence on monitoring finances – if someone has set a goal, they tend to put steps in place to ensure they meet it.

The research highlights how money management behaviours influence investment behaviours and saving and spending behaviours. Ensuring people have simple ways to manage their money that help them make healthy choices, is one way institutions can assist people with their financial wellbeing.

FIGURE 19 MONEY MANAGEMENT BEHAVIOUR MEAN SCORES (OUT OF 100)
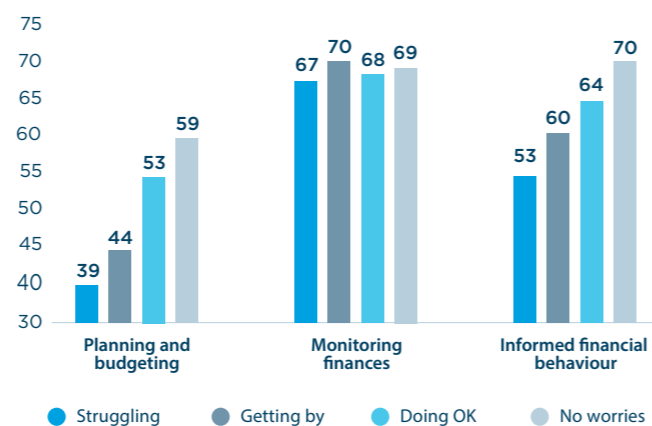

HAVING FINANCIAL KNOWLEDGE AND EXPERIENCE WERE THE KEY DRIVERS OF EXHIBITING INFORMED FINANCIAL BEHAVIOURS, WHETHER SOMEONE CONSIDERS DIFFERENT OPTIONS, INFORMATION OR ADVICE WHEN CHOOSING PRODUCTS OR MAKE FINANCIAL DECISIONS.
05

Behaviour traits influence financial wellbeing in different ways, some through improved financial confidence while others affected attitudes to saving and spending. 'Forward-looking' behaviour traits had the most significant impact.

Our analysis examined a number of behaviour traits and their impact on financial wellbeing. In particular, we explored whether someone was more future oriented, impulsive, concerned with their social status, exercised self-control, was action or goal-oriented, optimistic or frugal. Our model showed that these behaviour traits combined accounted for 13.4% of the explained variation in financial wellbeing score.

People with high levels of financial wellbeing (**no worries**) recorded higher average scores across all behaviour traits. People who were **struggling** recorded lower scores across most of the behaviour traits, in particular being starkly less optimistic and future-oriented than people in the **no worries** group. However, they did appear less impulsive and more frugal than people who were **getting by**, perhaps driven by necessity with more limited incomes and savings (Figure 20).

Our analysis showed that optimism, future orientation, impulsivity and frugality had the strongest influences on financial wellbeing. These different financial behaviour traits influence financial wellbeing along different pathways, through either financial confidence and control or saving and spending attitudes, to behaviours and financial wellbeing. Whether an individual is future-oriented, impulsive or frugal influences their attitudes to saving and spending (whether they have more of a saving or spending mindset). Their level of optimism influences how confident and in control they feel with their finances.

FIGURE 20 BEHAVIOUR TRAIT MEAN SCORES (OUT OF 100)

06

While not a strong influence on financial wellbeing, financial knowledge can influence people's confidence and control over their finances.
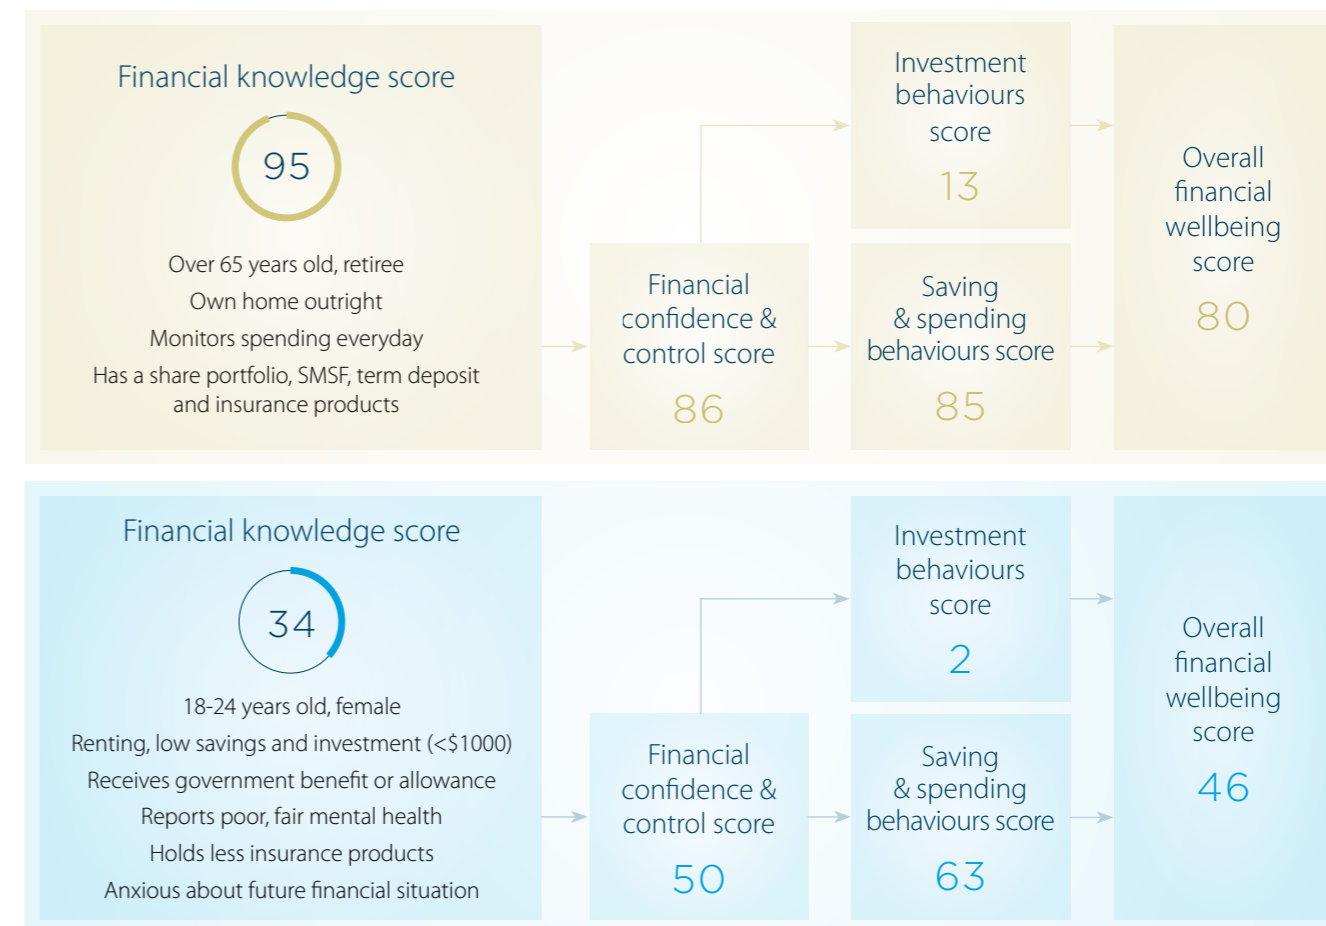

Financial knowledge (and to a lesser extent experience) work through other intermediaries to achieve a cumulative impact on financial wellbeing. Having financial knowledge can impact on an individual's financial confidence and control, which in turn influences the extent to which they will engage in saving and spending behaviours, and investment behaviours.

To illustrate this point, Figure 21 shows how two people, one with a high financial knowledge score (top 10%) and one with a low financial knowledge score (bottom 10%), achieve different financial wellbeing outcomes through influencing their financial confidence and control and how they behave. The person who scored high financial knowledge scored much higher for their financial confidence and control. They were generally confident about their ability to manage money day-to-day (96% of this group compared to 50% for the person with low knowledge), plan for the future (94% compared to 30%) and make decisions about financial

products (97% compared to 28%). They were also more likely to feel they could determine what happened in their life (70%) than the person with a low knowledge score (22%).

This stronger sense of financial confidence and control leads to improved saving and spending behaviours and investment behaviours for the person with high financial knowledge. The result is a financial wellbeing score of 80 (out of 100), significantly higher than the person with low financial knowledge (financial wellbeing score of 46). The difference between these groups is substantial (34 financial wellbeing points) but other aspects that add to financial wellbeing for the high knowledge group are also contributing to this gap (e.g. being retired, owning home outright). When these differences are accounted for in the model, the unique contribution of knowledge is not inconsequential, contributing 7.2 points[12] to the financial wellbeing score.

FIGURE 21 HOW KNOWLEDGE CAN INFLUENCE FINANCIAL WELLBEING (ALL SCORES OUT OF 100)

The following table shows how different financial wellbeing outcomes are achieved by the extremes of the four strongest behaviour traits through the different pathways. For example, the 'eternal optimist' has an average financial wellbeing score of 81, 46 points higher than their much more pessimistic counterpart. While we know there are other factors contributing to this, once these differences are accounted for in the model, the unique contribution of having a strong optimistic outlook adds four points to the financial wellbeing score.

Understanding their money personality can help someone to implement more positive behaviours to offset their natural instincts. For example, if someone knows they are more impulsive and less cautious, they know they will have a stronger spending attitude, will less likely actively save, exercise spending restraint and more likely borrow for everyday expenses, this can uniquely impact their financial wellbeing score by 5.7 points (following table). Implementing strategies such as having savings automatically locked away can help to counter these traits.

HOW BEHAVIOUR TRAITS CAN INFLUENCE FINANCIAL WELLBEING

		Behaviour trait (avg score/100)	Financial wellbeing (avg score/100)	Difference in financial wellbeing	Unique impact on financial wellbeing of behaviour trait
Optimism	High	100	81	46	4.0
	Low	14	35		
Future orientation	High	97	80	29	8.6
	Low	26	51		
Impulsivity (not impulsive)	High	100	71	17	5.7
	Low	21	54		
Frugality	High	100	69	15	5.9
	Low	31	54		

12 Knowledge has a standardised total effect of 0.076 on financial wellbeing; that is, a 1 standard deviation (sd) shift in knowledge produces a 0.076 sd shift in financial wellbeing. There is a difference of 61 points in the mean knowledge scores of the top and bottom 10% of the sample which equates to a difference of 3.52 sd. In turn, this is equivalent to a 0.267 sd change in financial wellbeing which translates to a 7.2-point change in the financial wellbeing score.

07

Whether a person has a stronger saving or spending attitude will have a direct effect on how they save, spend and use credit, which affects their overall financial wellbeing.

Saving and spending attitudes have a direct impact on whether someone actively saves, borrows for everyday expenses or exercises spending restraint. People with a higher saving and spending attitudes score (a stronger savings mindset) tended to have higher financial wellbeing. The mean saving and spending attitude score was 69 out of 100 for all Australians. People who were **struggling**, **getting by** and **doing OK** all had a below average saving and spending attitude score (58, 60 and 66 respectively) while people in the **no worries** group had above average attitudes to saving and spending (81 out of 100).

Notably, attitudes to saving and spending were positively correlated with the value of savings and investments held, particularly for accumulation of savings and investments up to $50,000 (Figure 22). Similarly, saving and spending attitude scores were higher for people with lower levels of consumer debt (Figure 22).

FIGURE 22 SAVING AND SPENDING ATTITUDES MEAN SCORES (OUT OF 100)

By value of saving/investments
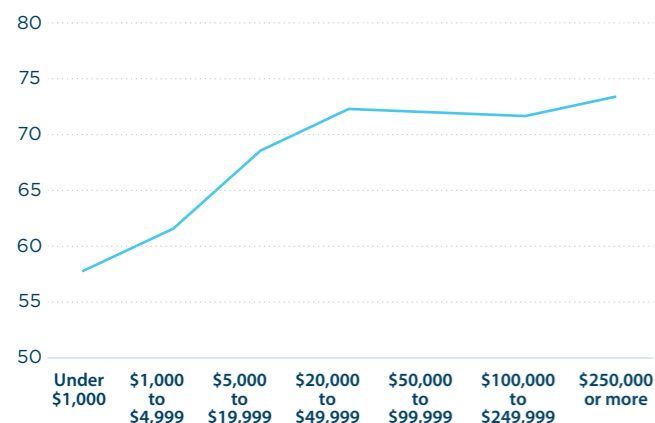

By value of consumer debt
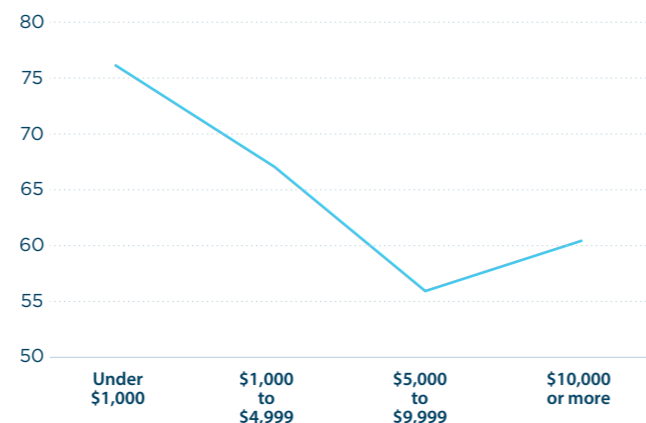

08

Financial confidence and a sense of control over our financial lives is key to improving saving, spending and investment behaviours.

Financial confidence and control also has a direct impact on whether someone saves, spends or borrows for everyday expenses. In addition, financial confidence and control is a key driver of longer term investment behaviours such as investing in property and shares.

People in the **no worries** group had high average confidence and control scores (83 out of 100), compared to those **doing OK** (68 out 100), **getting by** (57 out of 100) or **struggling** (48 out of 100). Financial confidence and control were positively correlated with the value of savings and investments held (Figure 23).

FIGURE 23 FINANCIAL CONFIDENCE AND CONTROL MEAN SCORES (OUT OF 100) BY VALUE OF SAVINGS/INVESTMENT
Encouraging a change in financial behaviours

Once we understand the drivers of financial wellbeing, developing actions to improve financial behaviours and therefore financial wellbeing, is a logical next step. Behaviour change frameworks widely used within the public health sector have significant potential to contribute to research, policy and practice in financial wellbeing. In this additional analysis, we have applied the COM-B model – Capabilities, Opportunity and Motivation = Behaviour used in *The Behaviour Change Wheel* (Michie, Van Stralen & West, 2011), created to assist in creating policies to promote the desired behaviours that contribute to healthier individuals and society. This research acknowledges the importance of context in predicting financial wellbeing – especially external factors including economic conditions, cultural and social norms, policies and interventions. Context is inherent to the COM-B framework. Essentially there are three factors that are necessary for an intentional behaviour to occur:

1. Capability – the skills needed to carry out the behaviour including knowledge, reasoning and physical abilities

2. Opportunity – an absence of external constraints that would prevent the behaviour such as physical resources and social opportunity and norms

3. Motivation – 'reflective' elements such as an intention to perform the behaviour, planning and beliefs about abilities, and 'automatic' elements such as reinforcement, emotions and default responses.

The COM-B model recognises that changes in one element will influence the other elements (figure below). For example, if capabilities are improved, it is likely that this will increase confidence and the motivation to engage in this behaviour in the future. Similarly, learning by doing, or actioning the behaviour will likely improve capabilities and enhance motivation.

THE COM-B SYSTEM
Source: Michie *et al.* (2011)

An analysis of the 2021 Financial Wellbeing Survey data was conducted to investigate the potential of the COM-B approach in identifying the 'blockers' and 'enablers' of the key saving and spending and investment behaviours that drive financial wellbeing. The table below shows the relative contribution of each COM-B domain to explaining the variation in each of the key financial behaviours. It shows that saving and spending behaviours are mostly driven by:

Motivation (50.6%) – particularly such motivating factors as a high degree of self-belief, a frugal attitude and a positive view of current levels of debt and future financial situation

Opportunity (33.7%) – particularly opportunities created by being able to easily meet mortgage/rent payments, having a relatively high and stable income, low levels of consumer debt, good health and not having caring responsibilities, especially those requiring the provision of financial support to parents and/or extended family members

Capability (15.6%) – particularly the ability to make well-informed financial decisions to have good self-control exhibited through the use of tracking tools to budget and control spending and to have completed formal post-secondary education.

Notably, motivation appears to play a larger part in driving active saving (49.7%) and spending restraint (51.3%), whereas an individual's opportunity – their income situation, difficulty paying housing expenses, level of consumer debt – is a much more significant driver of whether they are able to avoid borrowing for everyday expenses (47.2% contribution to the explanation of variation in this behaviour).

Investment behaviours are much more strongly associated with an individual's capabilities than saving and spending behaviours; knowledge and understanding of financial products and their associated risks, budgeting skills and formal post-secondary education were the capabilities with the greatest influence on investing behaviour.

Applying the COM-B model highlights that there are many different interventions that could be adopted to improve financial behaviours and therefore, financial wellbeing. For example, improving active saving behaviour might require more than enabling healthier choices. It could also include the development of intentions and goal setting, confidence in abilities and frugality. Interventions in product and service design such as setting and tracking savings goals and minimum savings buffers built into assessments for customers in hardship, will also reinforce savings behaviour. With opportunity playing the larger role in borrowing for everyday expenses, there is also a potential role for seeking ways to address broader policy issues such as housing costs, income and consumer debt to provide greater opportunities to develop a savings buffer.

09

Improved financial wellbeing leads to greater confidence and sense of control over our financial lives, reinforcing spending and saving behaviours.

Since the development of the revised Kempson *et al.* model in 2017, much consideration has been given to the role of financial confidence and its importance as a predictor of financial wellbeing. More recent thinking by Kempson *et al.* has hypothesised that financial confidence could not directly affect financial wellbeing – an individual would have to 'act' on this confidence in order to improve financial wellbeing through financial behaviours. Improvement in financial wellbeing in itself is likely to drive further financial confidence which, in turn, improves key financial behaviours and financial wellbeing. This 'feedback loop' allows for saving and spending and investment behaviours to be reinforced or validated through improved confidence from improved financial wellbeing (Figure 16).

The adjacent table shows the outcomes of our model of the effect on financial confidence of the key drivers that work through it. While knowledge and optimism were the largest influences on financial confidence and control, financial wellbeing had a similar influence on financial confidence and control as do other behaviour traits such as goal and future orientation.

INFLUENCES ON FINANCIAL CONFIDENCE AND CONTROL (STANDARDISED REGRESSION COEFFICIENTS)

	Influence on financial confidence and control
Knowledge and experience	
Knowledge	0.36
Experience	0.12
Behaviour traits	
Future orientation	0.15

Capability	25.1	16.9	27.8	15.6	42.8
Motivation	49.7	35.8	51.3	50.6	39.7

10

Knowledge of online risks did not strongly impact financial wellbeing for most, with younger people the least confident in their knowledge.

For the first time, our survey included questions on Australians' understanding of the risks associated with banking in an online world. In particular, did people feel they knew how to manage their money online securely via websites or apps? Did they know how to protect their online privacy and security? Could they recognise a scam email if they saw it and what experience did they have of scams and fraud?

While important, knowledge of online risk was not a strong driver of financial wellbeing. The average knowledge of online risk score was 78 out of 100 for the total population. This rose to 82 out of 100 for people with the highest levels of financial wellbeing (**no worries**) but did not fall substantially below the national average for people with lower levels of financial wellbeing. In fact, people who were **struggling** had knowledge of online risk scores in line with the national average (77 out of 100), with people **getting by** and **doing OK** scoring 75 and 76 out of 100 respectively.

KNOWLEDGE OF ONLINE RISK SCORES WERE LOWEST FOR PEOPLE AGED 18 TO 24 YEARS (72 OUT OF 100) AND HIGHEST FOR PEOPLE IN THE TWO AGE GROUPS 25 TO 34 YEARS AND 35 TO 49 YEARS (80 OUT OF 100).

On the whole, most Australians (81%) agreed that the statement that they could 'manage their money online securely using websites or apps' described them well or very well. This varied slightly across the financial wellbeing segments, ranging from 74% of people **getting by** to 88% of people in the **no worries** group.
Positively, 79% of older Australians (aged over 65 years) agreed with the statement that they could 'manage their money online securely using websites or apps' described them well or very well. This was lowest for people aged 18 to 24 years with 67% responding positively to this statement. However, a further 20% of people aged 18 to 24 responded neutrally about this statement.

The pandemic was a time when many people who may not have previously used online banking methods moved to card-based accounts as social distancing restrictions and various lockdowns were implemented. Digital channel usage in the last 12 months showed that people aged 18 to 24 years had greater preference for apps to do their digital banking (67%) although 42% had still used internet banking via a bank website. As age increased, there was a much stronger preference towards using internet banking. Four-fifths (81%) of people over 65 years of age used internet banking compared to only 26% of people over 65 using mobile banking apps (Figure 24).

FIGURE 24 DIGITAL CHANNEL USED IN THE LAST 12 MONTHS (%)

	Online/internet banking (e.g. using a bank website for internet banking)	A mobile banking app
18-24	42	67
25-34	69	80
35-49	79	78
50-64	83	58
65+	81	26

ALMOST THREE-QUARTERS (74%) OF AUSTRALIANS FELT CONFIDENT IN THEIR KNOWLEDGE OF HOW TO PROTECT THEIR SECURITY ONLINE, WHILE 69% EQUALLY FELT THAT THEY UNDERSTOOD HOW TO PROTECT THEIR PRIVACY ONLINE (DESCRIBES ME WELL/VERY WELL).
This response was consistent for most of the population over 25 years of age. However, younger people aged 18 to 24 years responded less positively about their understanding of how to protect their security and privacy online, with 67% and 60%

respectively feeling that the statements 'I understand how to protect my security online' and 'I understand how to protect my privacy online' described them well or very well. Older Australians (over 65 years) responded in line with the national average (72% and 69% respectively)

Most Australians were confident they could 'recognise suspicious links in emails, websites, social media messages and pop ups' with 83% responding that this statement described them well or very well. This was highest for those at both ends of the financial wellbeing spectrum with 85% of people **struggling** and 90% of people in the **no worries** group confident they could recognise suspicious links in emails, websites, social media messages and pop ups. Factors such as financial confidence that are associated with higher financial wellbeing may be influencing this for people in the **no worries** group. For people **struggling**, 18% reported that they had personally lost money in a scam or fraud, above the national average of 14%. This experience may have driven a level of caution when encountering potential scams (Figure 25).

It is also worth noting that the trend across age groups is consistent with whether people feel they could recognise suspicious links online. While most Australians over 25 years of age responded consistently with the national average (83%), only 69% of people aged 18 to 24 years felt this statement described them well or very well. However, a further 19% of people aged 18 to 24 responded neutrally about this statement. Experience with losing money in a scam or fraud was fairly consistent across age groups, however men were more likely to have had a financial loss than women (16% compared to 12%). The survey highlights risks around over-confidence with managing online privacy and security, the common propensity for humans to rate their skills above average and distorted self-assessment[13] or belief in system security, that can interfere with building new digital skills.

FIGURE 25 'I HAVE PERSONALLY LOST MONEY IN A SCAM OR FRAUD' (%)

CONCLUSION

The 2021 survey represents an evolution in how we model and measure financial wellbeing, drawing on developments in international research and practice in the areas of measuring and improving people's financial wellbeing since 2017.

This report aims to improve understanding of why people might behave the way they do, what is driving their behaviour and what factors, both internal and external, are 'blocking' and 'enabling' their financial wellbeing. The analysis draws on and validates the revised Kempson *et al*. (2018) model of financial wellbeing in the Australian context. It highlights a network of relationships or 'paths' between different drivers to determine their direct and indirect influence on financial wellbeing. For instance, how an individual's context (their socio-economic environment) and behaviour traits impact their knowledge, experience, attitudes and money management behaviours; how those intermediaries impact on financial confidence and control, saving and spending behaviours and investment behaviours; and finally, financial wellbeing outcomes.

THE SURVEY FINDINGS SUGGEST HAVING A FEELING OF SECURITY FOR THE FUTURE IS AN IMPORTANT COMPONENT OF FINANCIAL WELLBEING, IN ADDITION TO OUR ABILITY TO MEET EVERYDAY COMMITMENTS, HOW COMFORTABLE WE FEEL ABOUT OUR FINANCIAL SITUATION AND OUR RESILIENCE TO COPE WITH FINANCIAL SHOCKS.

Most importantly an individual's context is critical. The socio-economic conditions they face have the strongest influence on their financial wellbeing. Their behaviour traits – a tendency towards being more or less future-focused, more or less frugal, optimistic or pessimistic – will also impact their attitudes, confidence and how they behave.

That is not to say that how we behave – whether we actively save, borrow for everyday expenses, exercise spending restraint or invest – is not important. Financial behaviours have a role to play in ensuring we have the financial resilience to lessen the impact of socio-economic disruptions on our financial wellbeing over time. The significance of this is evident now more than ever as people have drawn on their reserves during a once-in-a-century global pandemic.

ANZ is committed to the ongoing monitoring and improved understanding of financial wellbeing. This work will continue to inform ANZ's initiatives to improve financial wellbeing for our customers, employees and the community as well as provide insights for a range or stakeholders that support policies and programs to better the financial lives of Australians at every life stage.

APPENDICES

A. LITERATURE REVIEW

Financial Wellbeing: Evolution of the concept, meaning and application

Professor Roslyn Russell, RMIT University

Since 2017, our understanding of what financial wellbeing means and looks like has evolved. We understand it to be complex, that it involves macro, meso and micro factors, and that it will ebb and flow along with life stages and events.

Research on this topic has since increased in volume and remains a cross-disciplinary effort. It has primarily focused on how to foster financial wellbeing, aiming to identify the factors that contribute most to financial wellbeing and how best to measure it.

The key areas of research have involved:

- Testing the efficacy of subjective versus objective indicators. There is a shift towards exploring the predictive powers of subjective indicators such as subjective knowledge rather than objective knowledge, perception of financial situation, financial self-efficacy with a reduced reliance on objective measures of finances and knowledge.
- The growing demand for digital literacy to be included as a critical part of the suite of skills necessary for financial capability.
- A recognition that life events and life stages should be explicitly accounted for in financial wellbeing models.
- The effects on financial wellbeing of a range of psychological factors such as materialism, social comparison, frugality and hyperopia. Increased understanding of vulnerability and resilience and how these factors relate to financial wellbeing.
- COM-B, (Capabilities, Opportunities, Motivations = Behaviour) is a framework widely used within public health that has significant potential to contribute to research, policy and practice in financial wellbeing.

More work is needed on:

- The contributing role of context in predicting financial wellbeing especially external factors including economic conditions, cultural and social norms, policies and interventions. Context is inherent to the COM-B framework.
- Understanding the 'why' behind financial attitudes and behaviours rather than just correlations.
- Exploring the link between mental health and financial wellbeing.
- The effect of COVID-19 on financial wellbeing longer term, increased importance on resilience, the trade-off between future financial wellbeing and meeting day-to-day needs.

Introduction

This Literature Review provides a brief update of the current international and national thinking on measuring financial literacy, capability and wellbeing to inform the data collection for the 2021 report. The 2017 survey adapted the Kempson *et al.* (2017) Conceptual Model of Financial Wellbeing. The Kempson *et al.* (2017) scale was used across a number of countries including New Zealand, Ireland, Norway and Canada. Since then, global circumstances have dramatically changed due to COVID-19, having a sudden and potentially long-term effect on our experiences of financial wellbeing. Research on the topic of financial wellbeing has also ballooned since 2017 with particular focus paid on what factors contribute to financial wellbeing.

In a similar vein, the 2021 survey takes into account how national and international thinking about financial wellbeing and capability has evolved and the effect of COVID-19, while ensuring some consistency with the 2017 survey for time series purposes.

The conceptual work on financial wellbeing continues to expand globally while largely maintaining agreement on the broad categories of what constitutes financial wellbeing.

In varying degrees financial wellbeing is determined by:

- **External factors** – socio-economic, structural, social and cultural norms, policies
- **Financial capabilities** – an interaction between knowledge, skills, behaviours and opportunity
- **Financial situation** – perceived and/or objective
- **Psychological factors** – attitudes, personality and psychological traits and biases
- **Time** – life stages, life events.

Definitions of financial wellbeing are also similar across studies (Kempson *et al.*, 2017; CFPB, 2015; Bruggen *et al.*, 2017; Muir *et al.*, 2017; Comerton-Forde, 2018) suggesting financial wellbeing is being able to meet financial commitments day-to-day and in the future, feeling financially comfortable, and having resilience to cope with financial shocks. Some definitions have also

incorporated feelings of security, having control and freedom, all of which depict a state of contentment and satisfaction with one's financial life with an absence of stress, anxiety or worry.

Brown & Bowman (2020, p.1) have called for our understanding of financial wellbeing to be underpinned by the concept of economic dignity. Financial wellbeing should mean that:

'Every person deserves to:

- › *have meaningful control over their financial decisions;*
- › *be treated with respect, regardless of financial situation;*
- › *be able to undertake work in a safe environment that is meaningful to them and that is valued by the community – including both paid and unpaid work;*
- › *be able to meet their basic needs.'*

With general agreement on the broad components of financial wellbeing, recent research has delved into more nuanced aspects which in turn influences how we measure these concepts. The recent work has included redefining financial literacy, proposing additional psychological traits as being important to financial wellbeing, the inclusion of digital literacy and the increased focus on subjective versus objective indicators.

Improving measurements of financial literacy

Financial wellbeing models have generally shown that objective knowledge alone contributes little to financial wellbeing (Kempson *et al.*, 2017; Kempson & Poppe, 2018; CFPB, 2018; Riitsalu & Murakas, 2019).

In the last few years, there has been growing evidence that an individual's perception of their financial knowledge – that is, their subjective knowledge – is a better measure of their financial literacy than assessments from objective tests, such as those developed by Lusardi & Mitchell (2007) which are widely used as a measure of financial literacy[14] (Warmath & Zimmerman, 2019; Bayuk & Altobello, 2019).

Subjective financial knowledge is measured as one's perceived overall financial knowledge and/or as one's perceived financial knowledge relative to others (Warmath & Zimmerman, 2019; Riitsalu & Murakas, 2019).

Warmath & Zimmerman (2019) have created and tested a re-conceptualisation of financial literacy in line with Bloom *et al.'s* (1956) domains of knowledge to include a combined measure of financial skill (psychomotor component), self-efficacy (affective component) and explicit knowledge (cognitive component). Warmath & Zimmerman (2019) developed and validated a formative scale for financial literacy using financial wellbeing as the validation measure. They show that combining a number of factors into a single measure can improve the measurement of financial literacy. The authors define financial literacy as 'one's capacity to make effective financial decisions, where "capacity" refers specifically to knowledge, skill and self-efficacy' (Warmath & Zimmerman, 2019, p.1623).

Importance of digital literacy

A growing stream of literature confirms the inescapable impacts of fintech on financial behaviours and financial wellbeing (Panos & Wilson, 2020). We have incorporated digital literacy into the conceptualisation and measurement of financial capabilities (for example, measures used by Lloyd Bank (2020) for financial digital literacy).

Given that Digital Financial Services (DFS) are the main, if not only, system used for financial transactions, it is therefore becoming more critical to narrow or eliminate the digital divide and view digital knowledge and skills as just as important as other forms of literacy such as reading and writing.

DFS has created enormous benefits for consumers. Transactions are fast, easy, widely accessible and secure, but there are also risks. Consumers have the right to know and understand how DFS can contribute to their financial wellbeing but must also be aware of and have the skills to manage and counter the risks that come with these services. Recommendations include incorporating digital literacy into the core competencies that comprise financial capabilities (OECD, 2018) and, by extension, financial wellbeing.

Consumers must understand the implications that come with their digital identity. They need to know how their digital profile can be used for their benefit by providing access to better tailored services and products. At the same time, they must be aware of how their profile can lead to new types of exclusion should data be misused and/or lead to the erosion of financial capabilities that would

otherwise promote financial wellbeing (OECD, 2018). Digital innovations can also foster over-indebtedness by making it easier for people to overspend or by increasing the accessibility to high-cost loans and online gambling (Panos & Wilson, 2020), all of which can have detrimental effects on financial wellbeing.

There is an increase in literature on the risks of digital crime with a call for consumers to have skills in identifying fraud attempts, phishing and other increasingly sophisticated scam activities (Engels *et al.*, 2020; Lee, 2018). Even more critical however, is having effective regulation and systems that protect consumers against fraud and scams. Losing money to fraud or other financial crimes can have not only financial impacts but also longer-term effects on people's financial confidence which in turn will impact financial wellbeing.

BEING DIGITALLY LITERATE CONTRIBUTES TO A CONSUMER'S FINANCIAL CAPABILITY IN THAT IT OFFERS THEM CONVENIENT ACCESS TO ONLINE BUDGETING TOOLS AND CALCULATORS, FINANCIAL GOAL TRACKERS AND THE EASE TO SAVE AND TRACK THEIR EXPENDITURE AS WELL AS GIVING READY ACCESS TO INFORMATION. THIS GRANTS THEM THE POTENTIAL TO HAVE MORE CONTROL OVER THEIR FINANCIAL LIVES (OECD, 2018; LLOYDS BANK, 2020).

A randomised control trial in Northern Ireland showed that people who used a suite of money management 'apps' were better able to keep track of their income and spending and also increased their financial resilience (French *et al.*, 2020).

An experimental study by Bayuk & Altobello (2019) explored the use of gamification in financial 'apps' and found that using a financial mobile app improved participants subjective financial knowledge rather than objective financial knowledge (as measured by Lusardi & Mitchell's 2007 questions). Their study suggests that using an app may help people feel more confident about their finances because it gives them control and ability to manage their money conveniently and easily.

---

14 Lusardi & Mitchell (2007) financial literacy questions include 1 "Suppose you had $100 in a savings account and the interest rate was 2% per year. After 5 years, how much do you think you would have in the account if you left the money to grow?" 2. "Imagine that the interest rate on your savings account was 1% per year and inflation was 2% per year. After 1 year, with the money in this account, would you be able to buy..." 3. "Do you think the following statement is true or false? Buying a single company stock usually provides a safer return than a stock mutual fund."

Life events

There is a tendency to think of financial wellbeing as a state one can achieve if they adopt the recommended behaviours, attitudes and goals. But life isn't static: every day involves new financial decisions and we face events that could affect our financial situation on a slight and temporary basis or plunge it into a deep dive. We may find it easier to put away savings at certain stages of our lives compared to others; and acquiring assets that contribute to financial wellbeing requires time. Conversely, the onset of disability and/or ill-health can suddenly or gradually affect our financial wellbeing.

Since the emergence of the financial wellbeing models of Kempson *et al*. (2017), CFPB (2015, 2018) and the Australian Muir *et al*. (2018) work, follow-up research from the Muir *et al*. study, recommends incorporating a life-course ecological model into our conceptualisation of financial wellbeing (Salignac *et al*., 2019). They call for closer attention to be paid to the effects of environment, age, life stage and life events when understanding financial wellbeing. The authors prefer the view that the individual is interacting with their environment rather than the environmental factors being separate as commonly depicted in the models. Collins and Urban (2020) have also recommended viewing financial wellbeing over the life-course and to include life events more overtly in the conceptualisation of financial wellbeing.

Future focus or Long-Term Orientation

Having a future focus or Long-Term Orientation (LTO) has consistently been found to be positively associated with financial wellbeing (Kempson & Poppe, 2018; ANZ, 2018, Tahir *et al*., 2021). Also important is that the future focus has positive feelings attached to it. Recent research exploring financial wellbeing in a two-country study of UK and Sweden since COVID-19 found that having a positive view of one's future financial situation is associated with higher levels of financial wellbeing (Barrafrem *et al*., 2020).

Having a Balanced Time Perspective (BTP) that tends to favour positive future orientation rather than dwelling on past and present in a negative way is associated with retirement planning behaviour (Mooney *et al*., 2017). In another study on time perspectives (TP), higher levels of future oriented time perspective are associated with a greater propensity for investing and making safer choices whereas riskier investment choices are associated with a higher level of present hedonistic time perspectives (Sekscinska *et al*., 2018). A meta-analysis on Future Time Perspective (FTP) shows that it is positively associated with wellbeing, health behaviours and retirement planning (Kooij *et al*., 2018).

Long-Term Orientation (LTO) was first conceptualised by Hofstede (1991) as one of a number of cultural measures used to compare societies. Hofstede described LTO as 'forward looking' versus a 'present or past looking' tendency. Australia scores quite low on the Long-Term Orientation versus Short-term normative orientation measure. The measure is 21 on a 0-100 scale which is one of the lowest in the OECD countries. In comparison, Norway scores 35, New Zealand 33 and UK scores 51.[15] The United States is also relatively low with a score of 26.

Having a future focus is critically important for financial security in later life and will indicate the likelihood of undertaking behaviours to plan for retirement. In Australia, although there is a compulsory retirement fund, many find it difficult to envision their 'future selves' and therefore find at retirement they don't have a future that is as financially secure as they would have hoped. Many feel that having a financially secure future will mean a less enjoyable present (Alonso-Garcia *et al*., 2018). The psychological tendency to prioritise the present and discount the future is well-documented (Luckman *et al*., 2020). In Australia there are continual efforts from all sectors to find ways to encourage individuals to better engage with their superannuation and ensure they have a solid plan for retirement (Smyrnis *et al*., 2019).

Knowledge, skills and behaviours

In the last few years, we have also learned more about the type of knowledge, skills and behaviours that contribute to financial capabilities. Interestingly, the growing consensus is that financial capabilities have less to do with budgeting (Kempson & Poppe, 2018; MAS, 2018; Greenberg & Hershfield, 2019) and more to do with life skills.

Skills found to be important to financial capabilities include:

- **Research** – how you find, process and use relevant information (CFPB, 2018)
- **Numeracy** (Sawatzki, 2017; Skagerlund *et al*., 2018)
- **Digital literacy** (French *et al*., 2020; OECD, 2018)
- **Problem-solving** (Sawatzki, 2017)
- **Coping with fear, anxiety and stress** (Skagerlund *et al*., 2018)
- **Deliberative thinking** (Stromback *et al*., 2017)

Psychological and social factors

There has been greater emphasis placed on the significance of psychological factors, traits and attitudes in financial wellbeing research. While the Kempson *et al*. (2017) model found certain factors to be important – for example, locus of control, low impulsivity, self-control, future orientation and optimism – other research has identified additional psychological factors that contribute to financial wellbeing:

- Financial self-efficacy (CFPB, 2018)
- Frugality (Comerton-Forde *et al*., 2018)
- Low materialism (Ponchio *et al*., 2019; Netemeyer *et al*., 2018)
- Low comparison to others (Madrian *et al*., 2017)
- Financial confidence (Despard *et al*., 2020)
- Self-control (Gathergood, 2012)

In a large study using a longitudinal UK data set, Furnham & Cheng (2017) explored the association between influential socio-demographic factors and financial wellbeing. The authors found that education, occupation, childhood intelligence and parental social status were significant predictors of financial wellbeing. Notably, Furnham & Cheng (2017) only included objective components in their financial wellbeing conceptual model – income, home ownership and living space.

Furnham & Cheng (2017) also included a malaise inventory and found that psychological distress had a significant effect on financial wellbeing.

Financial confidence

In a range of disciplines including education, health and psychology, confidence, along with motivation and other psychological traits, have long been found to be important in changing behaviours or predicting behaviour (Dixon, 2008). As an extension to the role of confidence in changing behaviour, reinforcement of that behaviour can in turn boost confidence. A positive feedback loop operates between known elements of behaviour change – knowledge, confidence, motivation and behaviour. A recent study from the health discipline has shown that when knowledge and competence improves, confidence is positively impacted and that confidence contributes to the relationship between knowledge, competence and behaviour (Lucero & Chen, 2020). Similarly, findings in a randomised control trial with young Australian adults, showed that improved confidence in undertaking particular health activities also contributed to better health outcomes and that confidence was a mediating effect on behavioural change (Partridge *et al*., 2017).

By borrowing the behaviour change concepts from health and other disciplines, we have seen the importance of confidence as a predictor of financial wellbeing becoming prominent in the research. Also referred to as subjective knowledge, financial confidence has been associated with behaviours that contribute to financial wellbeing such as saving and less costly use of credit cards (Lind *et al*., 2020). If an individual has higher levels of financial

confidence it may mean they are more likely to engage with financial information. Lind *et al*. (2020) found that financial confidence or subjective knowledge is more important than objective knowledge or financial competence in its effect on financial behaviours and attitudes towards financial matters. Lind *et al*. (2020) also found that subjective financial knowledge is a predictor of financial security. While we know that objective knowledge in itself contributes little to financial wellbeing, it does appear to increase confidence which in turn contributes to financial wellbeing.

There is however research that cautions against confidence without adequate knowledge as it can lead to over-confidence (Bucciol *et al*., 2021). A study that explored over and under confidence in people's propensity to prepare for retirement found that both situations can be detrimental to their likelihood of planning but for different reasons. People who have too much confidence without adequate knowledge don't think they need to undertake any retirement focused planning and those with under confidence but actually have adequate objective knowledge delay preparing because it is a daunting prospect (Angrisani & Casanova, 2021).

Locus of control

Having an internal locus of control is widely recognised as a positive trait that contributes to an individual's wellbeing including financial wellbeing (Kempson & Poppe, 2018; ANZ, 2018). Recognising that one's behaviours can make a difference to life's outcomes denotes an attitude of having a certain degree of control over one's situations.

In Furnham & Cheng's (2017) large, longitudinal study of the sociodemographic indicators of financial wellbeing, they found using structural equation modelling (SEM) that locus of control (at age 16) along with childhood intelligence, education and occupation predicted financial wellbeing.

Self-control

We know through the financial wellbeing measures to date, that impulsivity detracts from financial wellbeing and having self-control improves the likelihood of being able to save, avoid over-indebtedness and reach financial goals. John Gathergood (2012) has conducted the most definitive work in testing for the role of self-control and its effect on consumer over-indebtedness. He found that it has a stronger effect on over-indebtedness than low levels of financial knowledge. The study demonstrated that people who had low levels of self-control were more likely to use high-cost loans, experience financial shocks and be more exposed to financial risks than those with higher levels of self-control. Stromback *et al*. (2020) also confirm the importance of subjective self-control to financial wellbeing and financial behaviour. Notwithstanding these individual factors, we know the demand for high-cost loans is largely driven by external factors and the lack of options people have when there isn't enough money (Brown & Noone, 2021).

Materialism

Low materialism (Ponchio et al., 2019) is a psychological factor that has a positive influence on financial wellbeing. Chatterjee et al. (2019) found that overt materialism had a direct negative effect on financial wellbeing while socially-motivated aspirations had an indirect negative effect and was mediated by overt materialism. Materialism has been extensively researched in psychology and consumer research including its effects on subjective wellbeing (see for example Dittmar et al. 2014 for a meta-analysis).

There is general agreement that the values and traits underlying materialism are the antithesis to those that are associated with subjective wellbeing, happiness and life satisfaction (Burroughs & Rindfleisch, 2002; Belk, 1984, 1985).

Social and cultural norms

There is a growing focus on how social and cultural norms influence financial behaviours and therefore financial wellbeing (Bursztyn & Jenson, 2017; Greenberg & Hershfield, 2019; Brown & Noone, 2021). Peer groups, social circles and the community (reference groups of comparison) can influence our financial values, goals and behaviours. Comparing ourselves to our reference groups can have positive or negative effects on our wellbeing.

Social comparison

The concept of social comparison is closely linked to materialism and has a long history of research in social psychology and associated disciplines. One of the fundamental theories of social comparison tells us that in order to understand ourselves we evaluate our characteristics, such as our knowledge, beliefs, values and abilities, against a reference group normally comprised of our peers or social networks (Festinger, 1954). Social comparison theory also proposes that not only do we evaluate ourselves against others (Festinger, 1954), but we also have an intrinsic need to improve ourselves based on our comparison or perhaps feel validated or superior based on our evaluation. Social comparison researchers have generally accepted that there are three motives for comparison – self-evaluation, self-improvement and self-enhancement (Gibbons & Buunk, 1999). In observing the extensive self-help material available online and in bookstores or promised in workshops and classes, the theory seems to hold up.

Cultural norms

Cultural variables, similar to social norms, have been obscure in the financial wellbeing models. Does financial wellbeing look and mean the same across different cultures? We know that values, attitudes and behaviours can be very different in individualistic versus collective societies (Weier et al., 2018; Costa-Font et al., 2018). These factors are an important consideration given the growing multicultural populations in Australia (Melbourne Institute, 2019) and other countries. More work needs to be done to account for culture within our financial wellbeing models.

Hyperopia versus frugality

Hyperopia is characterised as a reluctance to or avoidance of spending money, especially on indulgences, viewing this as a barrier to achieving long-term goals. Borrowed from the medical field, the term 'hyperopia' refers to the condition of farsightedness – in which distant objects are clear in vision, but objects nearby are blurry. Recent discussion with Dr Dee Warmath (University of Georgia)[16] raised the awareness of the concept of hyperopia and its potential effect on financial wellbeing.

In the financial behaviour context, people with hyperopia are aware they avoid spending money and can readily acknowledge it. Moreover their hyperopia is characterised by feelings of regret in the future from foregoing indulgences that may have improved their satisfaction with life (Haws & Poyner, 2008). Consumer research focused on hyperopia suggests there are large segments of consumers who experience this trait (Pan et al., 2019). This may suggest that despite common wisdom, people are experiencing lower levels of financial wellbeing due to being overly cautious in expenditure.

While hyperopia or reluctance to spend may sound like another term for frugality which has been found to be a contributing factor to financial wellbeing (Comerton-Forde., 2018), it isn't the same. The difference, explored by Pan et al. (2019) is in the motivation. Pan and co-authors found through experimental research that hyperopia is a 'lack of motivation to spend' while frugality is lack of spending with a 'motivation to save' (p.349). In their research, both traits resulted in lower levels of spending but were for different reasons. In essence, self-control or Consumer Spending Self-Control (CSSC) and frugality can contribute to financial wellbeing while hyperopia may detract from financial wellbeing.

Financial vulnerability & resilience

A person's financial situation is comprised of objective (e.g. income, net wealth, assets and debt levels) and subjective elements (i.e. how a person feels about their situation; levels of worry). People's financial situation has been shown to be a significant contributor to financial wellbeing (CFPB, 2018; Riitsalu & Murakas, 2019).

The objective elements of a person's financial situation – their income, savings, assets, debts and employment circumstances, either constrain or expand choices which in turn dictate financial decisions (Morduch & Schneider, 2017). The detrimental effect of insecure work and lack of financial resilience on people's financial situation and therefore financial wellbeing has never been more evident than in the COVID-19 environment.

Recent research has furthered our understanding of financial vulnerability (O'Connor et al., 2019). O'Connor and colleagues distinguish between vulnerability and financial stress or hardship.

'Financial vulnerability is the risk of an individual falling into hardship (i.e. unable to maintain their standard of living) rather than a situation of living in a certain state of poverty or need. This means that anyone, regardless of wealth or income can be vulnerable'

(O'Connor et al., 2019, p.422)

Incorporating the increased focus on distinguishing between objective and subjective elements in conceptualising financial wellbeing, O'Connor and colleagues (2019) see vulnerability as being comprised of objective and subjective components.

Objective measures

- **Assets** – debt levels, savings, liquidity, income level, retirement saving and servicing credit card payments
- **Credit measures** – access to credit, credit score and cost to borrow
- **Non-income related factors** – insurances, education and employment security.

Subjective measures

- **Financial awareness** – being cognizant of one's financial obligations relative to assets which is influenced by age, education, psychological factors such as time orientation, cognitive abilities, financial literacy and experience with financial systems
- **Financial confidence** (over- or under-confidence) – in financial decision-making.

Even more interesting is O'Connor's et al. (2019) finding that even when objective factors remain constant, for example in cases of low income, subjective factors such as having high levels of awareness and confidence can act as a buffer to financial hardship.

High levels of consumer debt, especially credit card debt and use of high-cost credit (e.g. payday loans) contributes to vulnerability and negatively impacts financial wellbeing (Davies et al., 2019; Birkenmaier & Fu, 2018). The vulnerability is heightened if there is a disconnect between a person's perception of their financial situation or level of debt and the objective measure of their capacity to withstand a financial shock (O'Connor et al., 2019; Weier et al., 2018).

Context matters: economic, policy and structural factors

All financial wellbeing models acknowledge that external or macro factors play a role in our financial wellbeing, but these haven't received as much attention as the individual capabilities, behavioural and psychological factors (Fu, 2020). The ANZ (2018) report on the financial wellbeing of Australians found that socio-economic factors accounted for about 30% of the variables that contribute to our financial wellbeing. The UK financial wellness model includes 3 out 10 factors that are macroeconomic indicators including unemployment rate, GDP per capita and the Gini coefficient (Hayes et al., 2016).

The Centre for Social Impact (Brown & Noone, 2021) produced a valuable report that focuses on the importance of accounting for contextual factors in understanding financial wellbeing. Not only do the structural factors such as policies, the economy, natural disasters and pandemics need to be recognised and included but the *interaction* between these factors at the macro level, organisations (meso) and the individual (micro) should be better accounted for. The report identifies 75 different interactions or combinations of factors across the levels that impact financial wellbeing. Brown and Noone (2021) call for a more nuanced approach that integrates the structural factors to give a comprehensive understanding of financial wellbeing. In applying a systems lens to financial wellbeing, structural levers or drivers that can work together can be included 'as part of a suite of measures to improve financial wellbeing' (p.6) rather than relying upon individual factors to change in isolation.

16 Virtual meeting held 5 August 2020.

Elevating the value of subjective measures

Financial wellbeing measures included in the Kempson *et al*. (2017) model are more objective than subjective. Over the last few years there has been a strong shift to elevate the status of subjective indicators in measuring financial wellbeing.

'Understanding the financial well-being of households requires more holistic measures than account balances or pay stubs can capture'

(Collins & Urban, 2020, p. 341).

Netemeyer *et al*. (2018) suggest that measures that only focus on objective knowledge, behaviours and wealth confound financial wellbeing with financial behaviours. Their research suggests that perceived financial wellbeing is a significant component of overall wellbeing – even more than other components combined, such as job satisfaction, physical health and satisfaction with relationship support.

Using a range of methodologies, the authors have developed and validated constructs of perceived financial wellbeing. They found it includes two dimensions: a person's current feelings of money management stress and worry about their current financial situation, as well as how a person perceives their future security and financial goals.

Questions commonly used to measure subjective knowledge include:

› I feel quite knowledgeable when it comes to managing my finances.

› I think I know more than my peers about saving money and retirement programs.

› How would you assess your overall financial knowledge?

Condensing scales and use of proxies for FWB measures

Since the emergence of financial wellbeing scales including the CFPB (2015), Kempson *et al*. (2017), Kempson & Poppe (2018), and the Australian Comerton-Forde (2018) work, there have been efforts to condense these scales or to use proxies in existing surveys that work just as well. The motivation to do so is mainly to reduce respondent burden and increase efficiency in the use of resources in data collection and analysis (Botha *et al*., 2020).

ANZ has developed a Financial Wellbeing Indicator using a set of questions from Roy Morgan Single Source Interview and Survey as proxies for the Kempson *et al*. (2017) scale. This Financial Wellbeing Indicator tracks the financial wellbeing of Australians each quarter.

Further work has been done with the CBA-MI Reported Financial Wellbeing Scale developed by Comerton-Forde *et al*. (2018) to condense their 10-item scale to five items. Botha *et al*. (2020) in reducing the number of items have also shifted the emphasis to subjective indicators rather than objective.

Collins & Urban (2020) have illustrated how items from other databases can be successfully used as proxies for the established financial wellbeing measures by creating a 'pseudo-FWB scale measure' (p.342). The authors provide the example of using the US National Financial Capability Study (NFCS) to create proxies for the FWB scale.

The promise of the COM-B model to financial wellbeing

The COM-B model – Capabilities, Opportunity and Motivation = Behaviour (Michie, Van Stralen & West, 2011) is a theory driven, system approach developed in the public health disciplines. It was created to help understand where the barriers lie in behaviour change and to create policies better targeted towards promoting the desired behaviours that contribute to healthier individuals and society.

Michie and colleagues noted that most behaviour change models fail to adequately account for context and external factors that shape behaviours. In the COM-B model, the Opportunity component refers to the context. Michie *et al*. (2011) argue 'that behaviour can only be understood in relation to context. Behaviour in context is thus the starting point for intervention design.'

The COM-B model explicitly incorporates the internal (psychological), physical and external factors that drive behaviour. It is comprised of Capabilities, Opportunities, Motivations which activate Behaviours. Essentially there are three factors that are necessary for an intentional behaviour to take place:

1. Skills needed to carry out the behaviour

2. An intention to perform the behaviour

3. An absence of external constraints that would prevent the behaviour.

Michie *et al*.'s (2011) COM-B model depicts behaviours as a 'system' that is interactive, with positive and negative feedback loops. Importantly it recognises that changes in one element will influence the other elements. For example if capabilities are improved, it is likely that this will increase motivation to engage in this behaviour in the future. Similarly, learning by doing, or actioning the behaviour will likely improve capabilities and enhance motivation.

B. SURVEY METHODOLOGY

The 2021 ANZ Financial Wellbeing Survey was conducted in Australia as an online interview:

Online survey

- 25 minutes duration
- Nationally representative sample of Australian adults, aged 18 years and over
- Total responses received: n=3,552
- Panel: Roy Morgan Single Source, Cint
- Australia-wide
- Quotas set for age, gender and location
- Data post-weighted to latest ABS population estimates for age, gender and location, housing tenure (renting/not renting), education level (university degree/no university degree), household income (less than $50,000 per annum/not less than $50,000 per annum), savings and investments (less than $1,000/not less than $1,000)
- Fieldwork dates: 21 May – 8 Jun 2021

C. TECHNICAL APPENDIX

As in 2017, ANZ's 2021 Financial Wellbeing project drew heavily on the conceptual model proposed by Kempson and Poppe[17] (see Figure 2 in the body of this report). This model defines financial wellbeing broadly as "*the extent to which someone is able to meet all their current commitments and needs comfortably, and has the financial resilience to maintain this in the future*". This definition suggests financial wellbeing is comprised of three components; meeting commitments, feeling comfortable and resilience for the future. We retained this fundamental view of financial wellbeing for the 2021 research. However, in order to more specifically address people's expectations of their financial wellbeing in the longer term[18], a fourth component (*expectations of future financial security*) was added to the definition of financial wellbeing.

As shown in Figure 2, the model also suggests that financial wellbeing is influenced by a range of factors including people's financial behaviour, their personality traits and financial attitudes, their financial knowledge and experience, and various aspects of their social and economic environment. A standard set of survey questions has been developed by Kempson *et al.* to measure the three components of financial wellbeing and many of the things which influence it; these questions provided the basis for an online survey of 3,552 Australian and 1,505 New Zealand adults which was conducted by Roy Morgan Research during June 2021.

While the final set of questions we used was generally in line with these items and also much the same as those used in the 2017 ANZ Financial Wellbeing survey, it should be noted that:

- Additional items were used to measure the fourth component of financial wellbeing (i.e. future expectations of financial security)[19]
- A number of changes were made in the items used to measure the money management behaviours of *planning and budgeting and monitoring finances* in an attempt to improve their ability to predict financial wellbeing compared to 2017. Changes were also made to the items used to measure respondents' knowledge of risk in order to bring its measurement more into line with current online issues.
- Given its particular relevance in the Australian context to superannuation and retirement funding, *investment behaviour* was added to the set of money use behaviours, and
- Several additions were also made in the areas of personality traits[20] (specifically optimism, goal orientation and frugality) and socio-economics (in particular, specific measures of physical and mental health, access to support from family, friends and neighbours/community and changes in household expenditure).

The other key difference from 2017 lay in our approach to analysis of the relationships between financial wellbeing and the factors which influence it. While 2017 used linear regression to establish the relative importance of influencing factors, it is acknowledged that other analytic approaches have the potential to enhance understanding in this field.

For example, Kempson *et al.* writes[21]

'... there is a need to better understand the pathways to higher levels of financial well-being: how the various factors are linked together and what mechanisms are responsible for establishing those links. This calls for a different methodological approach, partly qualitative studies and partly path analysis (SEM) rather than a series of stand-alone regressions.'

With this in mind, we have used structural equation modelling (SEM) as the fundamental analytic approach to understanding the relationships inherent in the financial wellbeing model shown in Figure 2.

While offering enhanced insights into financial wellbeing and its relationship to behaviour etc, this approach is not without some limitations. In particular, the literal application of SEM to the Kempson *et al.* model depicted in Figure 2 requires the consideration of a very large number of variables and, as a consequence, has the potential for a considerable number of paths that would need to be accommodated by the modelling. To this end, one of the important tasks we faced in preparing the survey data for use in SEM, was reducing the number of influencing variables in the model by developing summary indices wherever possible. Methods for doing this, as well as the other main data preparation processes, are outlined in the following sections.

Variable preparation

The data obtained from this survey underwent a process in which each survey variable relevant to the model framework was made suitable for use in constructing the separate model components and domains. Following Kempson's recommended approach, this involved making sure that every variable to be used in the analysis included all valid cases in the sample. Missing responses (such as 'don't know' and 'prefer not to answer') were recoded to the most relevant meaningful response category; typically, to either a middle value within the scale, or to the most common ('modal') value.

To facilitate interpretation, response categories were re-ordered where necessary to ensure that a low score corresponded to low capability or wellbeing and a high score to high capability or wellbeing.

Finally the analysis variables were allocated to the relevant level and element of the conceptual framework (as shown in Figure 2); for example, a component of financial wellbeing, a type of behaviour or a particular financial attitude.

Component and summary index derivation

In keeping with the approach used by Kempson *et al.* the explanatory variables were: (1) direct survey measures or (2) variables constructed by a scaling procedure (referred to as "components" henceforth). Commonly Principal Components Analysis (PCA) was used to construct scaled components once they had been treated as described above. To this end it is important to note that all exogenous and endogenous variables in the SEM were effectively "observed" variables (i.e. not latent variables) with the sole exception of financial wellbeing which was operationalised as a latent variable with 15 observed items defining it.

The reliability and sampling adequacy of each scaled variable was tested using Cronbach's alpha and the Kaiser-Meyer-Olkin (KMO) statistics respectively; no serious data inadequacies were revealed by this process.

PCA creates a standardised score[22] for each respondent so for ease of interpretation these were rescaled to achieve a potential score ranging from a true minimum of 0 to a true maximum of 100. In keeping with Kempson's approach, where the minimum and maximum possible component scores were not obtained by any respondent, we created 'fake' cases with the minimum score on each variable contributing to that component and, if necessary, another with the maximum score on each variable. The PCA was re-run including these two minimum/maximum cases, ensuring all respondent scores were truly scaled between 0 and 100. The 'fake' cases were then removed.

In addition, for detailed reporting purposes, we also calculated simple average scores for each component and summary index. This approach was developed because of its transparency and also, because the scores are not standardised and thus more readily support comparisons between subgroups as well as across different data sets. The approach involved rescaling each contributing variable to a score out of 100, summing the relevant variables for each component and then obtaining the mean score (out of 100) for the component. It should be noted that these average scores were the ones used for reporting the results shown in the body of this report; the PCA-based scores were used for modelling work only.

17 Elaine Kempson & Christian Poppe, *Understanding Financial Well-Being and Capability- A Revised Model and Comprehensive Analysis*, Consumption Research Norway – SIFO; Professional Report no. 3 – 2018; p74.

18 As recommended by various researchers including Warmath et al (see reference below) and to ensure contextual relevance in Australia in particular given the nature of the pension system and approaches to statutory superannuation.

19 Netemeyer R., Warmath D., Fernandes D., Lynch J., *How Am I Doing? Perceived Financial Well-Being, Its Potential Antecedents, and Its Relation to Overall Well-Being.* Journal of Consumer Research. October 2017; p89.

20 We note that the personality traits that are a proposed in the Kempson & Poppe 2018 model are those that have been identified as being useful explanatory variables for financial well-being and not a complete inventory of all personality traits per se. As such, and because of their potential role in influencing financial behaviours we later refer to these as "behavioural traits".

21 ibid p81.

22 That is, the number of standard deviations the respondent's score is from the mean of a normalised distribution with a mean of zero and a standard deviation of one.

TABLE A1 ITEMS USED TO DEFINE SEPARATE COMPONENTS AND SUMMARY INDEX OF
FINANCIAL WELLBEING AND ASSOCIATED MEAN SCORES (OUT OF 100)

Financial wellbeing				Individual components		Overall financial wellbeing index		
Summary index	Components	Individual survey items	Item loadings	PCA score	Simple average score	Item loadings	PCA score	Simple average score
Overall financial wellbeing	Meeting commitments	Q12 How often do you run short of money for food or other regular expenses?	0.891	78	77	0.746	64	64
		Q13 Which of the following statements best describes how well you are meeting your bills and credit commitments at the moment?	0.850			0.763		
		Q15 In the past 12 months, how often have you been unable to pay bills or loan commitments at the final reminder due to lack of money?	0.860			0.624		
	Feeling comfortable	Q9 How often do you have any money left over after you have paid for food and other regular expenses?	0.887	64	64	0.800		
		Q10 How would you describe your current financial situation?	0.841			0.722		
		Q11 How confident are you about your financial situation in the next 12 months?	0.821			0.778		
		Q14 How well do you think this statement fits you personally? *'My finances allow me to do the things I want and enjoy life'*	0.849			0.792		
	Financial resilience	Q16 If tomorrow you had to meet an unexpected expense that is equivalent to a month's income for your household, how much of it would you be able to cover from money you have available either in cash or in your bank account?	0.886	61	60	0.779		
		Q17 Would you need to borrow, overdraw your account or use a credit card to meet an unexpected expense equivalent to a month's income?	0.832			0.681		
		Q18 If your income fell by a third, for how long could you meet all your expenses without needing to borrow?	0.825			0.750		
		Q19 Thinking about the total income of your household, approximately how many month's income do you have in savings?	0.856			0.710		
	Security for the future	Q45(1) I am becoming financially secure	0.913	56	56	0.762		
		Q45(2) I will be financially secure until the end of my life	0.919			0.738		
		Q45(3) I am securing my financial future	0.902			0.739		
		Q45(4) I have saved (or will be able to save) enough money to last me to the end of my life	0.897			0.717		

TABLE A2 ITEMS USED TO DEFINE SEPARATE COMPONENTS AND SUMMARY INDEX OF
FINANCIAL BEHAVIOUR AND ASSOCIATED MEAN SCORES (OUT OF 100)

Financial behaviour				Individual components		Summary components		
Components used in SEM	Individual components	Survey items	Item loadings	PCA score	Simple average score	Item loadings	PCA score	Simple average score
MONEY USE BEHAVIOURS								
Saving and spending behaviours	Active saving	Q22 How often do you save money so that you could cover major unexpected expenses or a fall in income?	0.802	71	70	0.712	76	76
		Q23(1) How well do these statements describe you personally? *'I try to save money to have something to fall back on in the future'*	0.898			0.791		
		Q23(2) I try to save money regularly even if it is only a small amount	0.856			0.710		
		Q23(3) I always make sure I have money saved for bad times	0.897					
	Not borrowing for day to day expenses	Q24 How often do you have to borrow money or go into debt to buy food or to pay expenses because you have run short of money?	0.901	84	84	0.705		
		Q25 How often do you have to borrow money to pay off debts?	0.895			0.668		
		Q21(3) How often do you incur a fee for going into negative balance on your everyday bank account?	0.733			0.601		
	Spending restraint	Q20(1) How well do these statements describe you personally? *'I run short of money because I overspend'*	0.920	75	75	0.632		
		Q20(2) I am impulsive and tend to buy things even when I can't really afford them	0.920			0.574		
Investing behaviours	Investing behaviours	Q5/ Q5A Products held alone or jointly... * An investment property financed by a loan/mortgage	na	na	6.5	na	na	6.5
		* An investment property that is not financed by a loan/mortgage						
		* Investment or margin loan						
		* Managed Fund						
		* Share Portfolio						
		* Self-managed super fund						
		Q27(1) Have a plan to make sure there is money available for investment purposes (codes 4 or 5)						

Financial behaviour (continued)

Components used in SEM	Individual components	Survey items	Individual components — Item loadings	Individual components — PCA score	Individual components — Simple average score	Summary components — Item loadings	Summary components — PCA score	Summary components — Simple average score
MONEY MANAGEMENT BEHAVIOURS								
Planning/ budgeting	Planning/ budgeting	Q26 Do you have a plan or a budget for how your regular income will be used?	0.856	52	52	0.856	52	52
		Q28 How often do you keep to the plan for using your income(s)?	0.913			0.913		
		Q27(1) To make sure there is money available for investment purposes	0.739			0.739		
		Q27(2) To make sure there is money available for unexpected expenses or emergencies	0.922			0.922		
		Q27(3) To save money for a specific goal like a holiday, wedding, home deposit, etc	0.874			0.874		
		Q27(4) So there will be enough money to pay regular bills on time	0.921			0.921		
		Q32 In the last 12 months have you personally done any of the following… 1. Had your account set up so that your savings are put aside automatically 2. Used any budget tool to help you achieve investment or savings goals 3. Assigned specific amounts of money to different accounts based on your specific expenses and savings goals (e.g. savings goal, emergency fund, bills and expenses, money available to spend) 4. Used an automated method to pay your bills (e.g. using direct debits)	0.458			0.458		
Monitoring finances	Monitoring finances	Q31a Done any of the following in the last 12 months… Checked your account transaction records	0.770	71	69	0.770	71	69
		Q31c Tracked your spending and/saving either manually or automatically through an app or online tool	0.754			0.754		
		Q31d Reviewed your transactions records and receipts to help you identify where you're spending	0.864			0.864		
Informed financial behaviour	Informed product choice	Q34/35 Before you got this <INSERT NAME OF PRODUCT RANDOMLY SELECTED FROM Q33>, did you personally search for information from a range of sources?	0.902	58	57	0.618	65	64
		Q36 Did you personally consider many alternatives before you decided which <PRODUCT>, to take out or renew?	0.956			0.694		
		Q37 How carefully did you personally check the applicable fees and other conditions of the <PRODUCT> before you took out or renewed it?	0.888			0.711		
	Informed decision making	Q38(1) How well do these statements describe you personally. I always get information or advice when I have an important financial decision to make	0.808	70	70	0.682		
		Q38(2) I spend a lot of time considering the options before I make financial decisions	0.893			0.715		
		Q38(3) When I make financial decisions, I always do a lot of research	0.888			0.771

		Q43Z	Z. I am feeling optimistic about my future.	0.938					
		Q43AA	AA. The future is looking bright to me.	0.933					
Frugality	Frugality	Q20(3)	If I can re-use an item I already have, there's no sense in buying something new	0.754	75	75			
		Q20(4)	There are things I resist buying today so I can save for tomorrow	0.762					
		Q20(5)	I control myself so that I make sure that I get the most from my money	0.794					

TABLE A4 ITEMS USED TO DEFINE SEPARATE COMPONENTS AND SUMMARY INDEX OF FINANCIAL KNOWLEDGE AND FINANCIAL EXPERIENCE AND ASSOCIATED MEAN SCORES (OUT OF 100)

Financial knowledge and experience

Components used in SEM	Individual components		Survey items	Item loadings	PCA score	Simple average score	Item loadings	PCA score	Simple average score
					Individual components			**Summary components**	
Financial knowledge	Product knowledge	Q41(1)	*How would you rate your knowledge of …* Bank accounts and other products to help you manage your money day-to-day	0.844	67	67	0.669	67	66
		Q41(2)	Longer term financial investments to help you improve your financial situation and plan for retirement	0.841			0.690		
		Q41(3)	How to find more information about a financial product or investment when you feel you don't know enough to make a decision on your own	0.859			0.690		
	Knowledge of financial product risk	Q42(1)	*How well do you understand the risks associated with…* Investing in the share market	0.835	57	57	0.676		
		Q42(2)	Going guarantor for someone else's loan	0.752			0.597		
		Q42(3)	Margin loans	0.732			0.553		
		Q42(4)	Online banking	0.521			0.652		
		Q42(5)	Term deposits	0.760			0.689		
		Q42(6)	Borrowing money to invest	0.835			0.695		
	Knowledge of online risk	Q39(1)	*How well do these statements describe you personally…* I understand how to protect my privacy online	0.870	78	78	0.600		
		Q39(2)	I can manage my money and bank transactions online securely via websites or apps	0.733			0.499		
		Q39(3)	I can recognise suspicious links in emails, websites, social media messages and pop ups	0.797			0.499		
		Q39(4)	I understand how to protect my security online	0.895			0.592		
Financial experience	Money management experience	Q7(1)	*What role do you play in the following activities?* Planning how the money in your household is spent	0.878	89	89	0.832	69	65
		Q7(2)	Ensuring that regular household expenses e.g mortgage, household bills or repayments on money borrowed are paid	0.839			0.806		
		Q7(3)	Making the financial decisions in your household	0.880			0.846		
	Financial product experience	Q5/Q5A	Which of these different financial/bank accounts and products do you have, either on your own or jointly with someone else? **Number of products held**	0.834	31	30	0.522		
		Q33	Have you personally been responsible for buying or renewing any of the following products in the past 3 years? **Number of products bought/renewed**	0.834			0.375		

Socio-economic variables

Typically, socio-economic variables present some difficulties when used in financial wellbeing explanatory modelling. These difficulties include:

- The relatively large number of variables that are generally collected, a number which is usually exacerbated by the categorical nature of many socio-economic measures and consequent requirement for dummy coding;

- The inter-relationships between many of the socio-economic variables (e.g.: level of education, occupational status and income all tend to be inter-related) that give rise to multicollinearity problems which typically require at least some variables, often variables of particular interest to researchers, to be dropped from modelling analyses even though they would have a legitimate role.

TABLE A5 OUTCOME OF PCA PERFORMED ON A SET OF 24 SOCIO-ECONOMIC VARIABLES

Survey items	Life journey	Earning potential	Unemploy-ment	Health concerns	Dependent children	Male gender	Financial stability	Social support
Retired	0.832							
Age (increasing)	0.804							-0.191
Age pension (govt. benefit & retired)	0.618		-0.197					
Paying mortgage/rent (Not easy --> Easy to manage)	0.449			-0.427	-0.215			
Level of Post-secondary education		0.749						
Occupation: Professional/senior manager		0.682				0.273		
Occupation: Lower blue collar		-0.598				0.231		
Household Income (low --> high)	-0.341	0.442	-0.339	-0.293		0.266		
Change in household income (decrease --> increase)			-0.657				0.228	
Lost job/redundancy in last 12 months			0.596					
Looking for work			0.562	0.182		0.183		
Welfare NOT retired – Govt benefit		-0.247	0.385	0.391	0.238	0.282		
Overall physical and mental health (poor --> excellent)				-0.707				
Illness in last 12m --> at least 2m off work				0.514				
H'hold expenditure increased sig. in last 12m				0.387		-0.244		
Single Parent					0.717	-0.257		
Number of dependent children	-0.265				0.671			
Provide financial support to adult child	0.244				0.483	0.364	-0.274	
Gender (non-binary; female; male)						0.777		
Stability of hh income (low --> high stability)	0.184		-0.279			0.184	0.620	
Consumer debt is less than $1,000	0.272						0.527	
Received significant inheritance in last 12m	0.191			0.246		0.221	-0.300	0.665
Access to social support (low --> high)	-0.196			-0.203		-0.186		0.624
Parents did not discuss finances when growing up	0.235			0.261				-0.437
Mean score (out of 100)	34	50	38	36	21	46	54	25

Socio-economic conditions – item loadings

Notes:
1. Only the highest loadings are shown in this table; low loading values have been omitted to aid interpretation. The largest factor loadings are highlighted in bold blue type.
2. The sign of the factor loadings in the above table is related to the direction that socio-economic variables were coded. For example, among the variables associated with "Unemployment issues", change in household income is coded so that higher income in the last 12 months has a higher score. As expected, this has a negative correlation with loss of jobs and hence its loading is negative whereas the job loss loading is positive.

To minimise these difficulties, we adopted a slightly different approach to handling the socio-economic variables. Preliminary correlation and regression analyses were used to evaluate the potential of all socio-economic variables collected in the survey to impact financial wellbeing. This enabled us to reduce these variables to a set of 24 which were then entered into an exploratory factor analysis; this analysis provided a descriptively useful solution with eight distinct factors as shown in Table A5. Note that the labels given to these factors e.g. 'earning potential' were merely convenient short-hand labels – readers should familiarise themselves with the socio-economic variables that are key to each factor to understand the essence of each.

There is a view that the inclusion of categorical variables in standard factor analysis may produce unreliable results and, as there was a small number of categorical variables in the above-mentioned factor analysis, we validated the outcomes with a parallel analysis of the 24 variables using the SPSS CATPCA procedure in which these variables were transformed using optimal scaling procedures.

A SEM of financial wellbeing in Australia

On completion, these analyses provided a set of components which could be used to establish an explanatory structural equation model of financial wellbeing that was consistent with the Kempson model *et al.* introduced in Figure 2.

Influences on financial wellbeing

A particular benefit of the SEM lies in its ability to quantify the comparative influence on financial wellbeing attributable to each of the model components; this is shown by the standardised effects coefficients presented in Table A6. The various explanatory components in this model as listed in Table A6, have either direct or indirect[23] influences on financial wellbeing depending on their placement in the model. As shown earlier in Figure 2, the money use behaviours of saving, spending and investment and the eight conditions comprising the socio-economic environment have a direct influence on financial wellbeing. Hence, in Table A6, they show direct standardised regression coefficients in the `Direct Effect' column. In addition, Table A6 shows that:

- The saving and spending behaviours and the socio-economic conditions also have small indirect effects on financial wellbeing as a result of their influence on people's financial knowledge, experience, attitudes and confidence

- Consistent with the Kempson *et al.* model, the remaining components of the model have indirect effects on financial wellbeing mediated through people's money management, money use and investment behaviours.

The total influence of each explanatory component in the model is described by the "Total Effect" value in this table – this is calculated as the addition of the Direct and Indirect Effects. The table demonstrates the key importance of saving and spending behaviours, health, unemployment and earning potential as determinants of people's financial wellbeing. There are however many influences on financial wellbeing that each have varying levels of influence on the outcome – this complexity is as would be expected for a complex social phenomenon like financial wellbeing.

TABLE A6 STANDARDISED EFFECTS OF MODEL COMPONENTS ON FINANCIAL WELLBEING

	Standardised effects on FWB		
	Indirect effect	Direct effect	Total effect
Money use behaviours			
Saving and spending behaviours	0.01	0.46	0.47

Male gender	0.02	0.12	0.14
Financial stability	0.05	0.11	0.16
Social support	0.01	0.16	0.17

23 An indirect effect represents the product of all paths that lead to financial wellbeing from explanatory components that do not link directly to financial wellbeing.

A SEM representation of financial wellbeing in Australia

The model developed is summarised in the figure below. Due to the large number of paths, this figure has been simplified to only show specific paths for the 'top' of the model. It should be noted that all relationships retained in the model were statistically significant; however, while the model could have been simplified by removing those elements with minimal influence on financial wellbeing, we chose to retain them so as not to diminish the overall ability of the model to explain financial wellbeing.

This approach in turn had some negative effect on the final model's goodness of fit (RMSEA=0.097) however the R^2 figure of 0.75 indicates the total set of components used provided an excellent explanation of the variation in people's financial wellbeing scores.

Another important feature of this model is how financial wellbeing was operationalised. As it is the most critical construct in the model, financial wellbeing was implemented as a latent variable with 15 indicators – the indicators were identified in earlier in Table A1 and fall into the domains Meeting commitments, Feeling comfortable, Financial resilience and Security for the future.
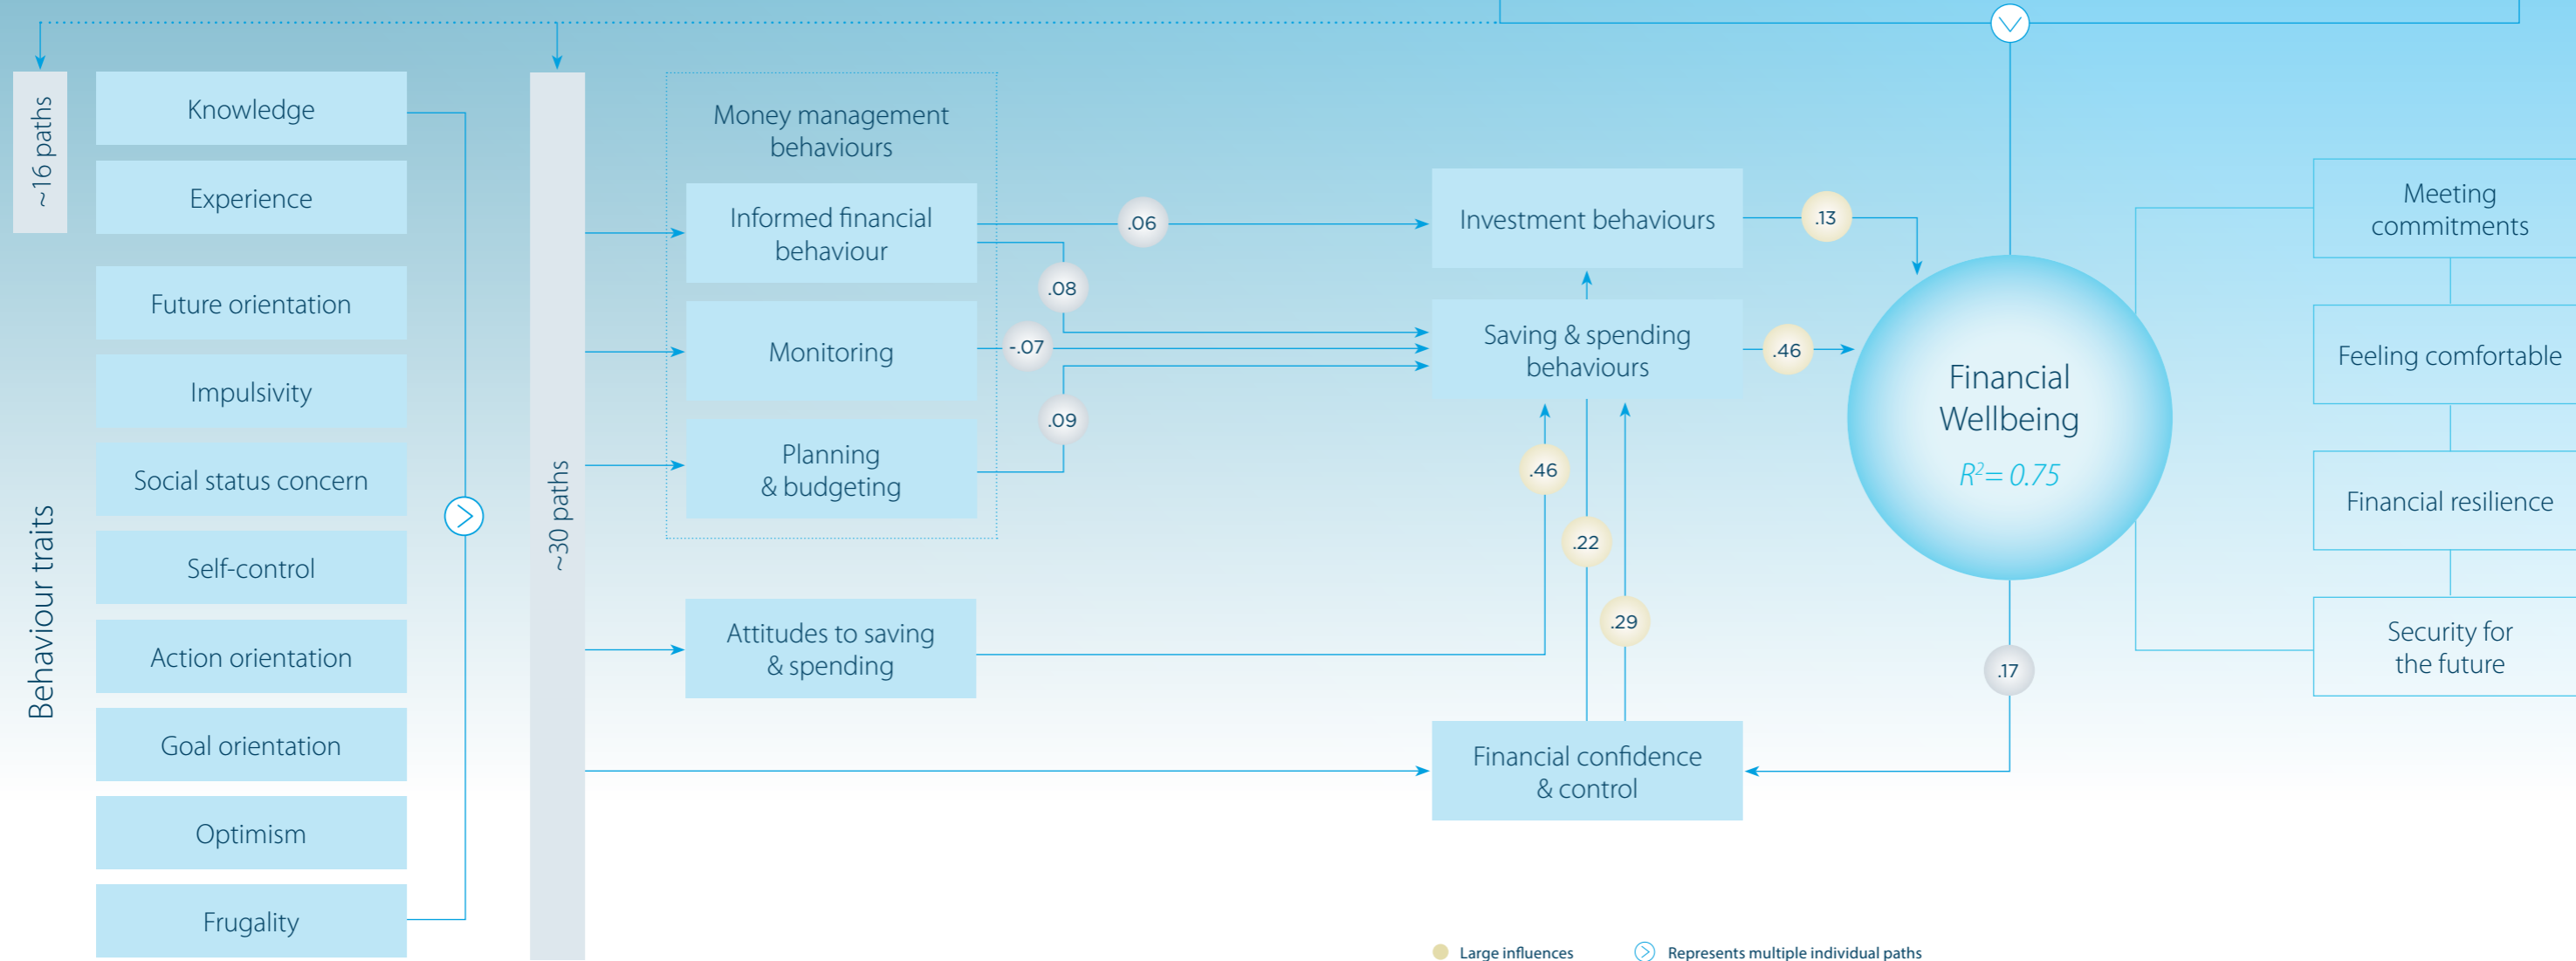

The figure below also shows the standardised regression coefficients associated with each path at the top of the model, that is, the part that directly leads to financial wellbeing. These coefficients point to the strong influence of saving and spending behaviours, health, employment and income on financial wellbeing; they also show the importance of psychological factors such as positive financial attitudes and confidence in driving saving and spending behaviours.

Of particular interest in this model is the relationship between financial wellbeing and financial confidence and control; the path shown reflects the view that financial confidence and control only

exerts an indirect influence on financial wellbeing through its impact on saving and spending, and investment behaviours. In addition it should be noted that a feedback loop is present whereby financial wellbeing has a direct influence on financial confidence and control – this feature was proposed by Elaine Kempson and made inherent sense in that it allows for a mechanism of reinforced change over time via the circular action of individuals experiencing change in financial wellbeing from improved financial behaviours which, in turn, reinforces those behaviours via the mediation of improved financial confidence and control.

SUMMARY OF FINANCIAL WELLBEING

Structural equation modelling (SEM) showing paths and standardised regression coefficients for the 'top' of the model
