Job Ads slide further in November

ANZ Australian Job Ads fell 1.7% m/m in November, following a 1.0% m/m drop in October. Job Ads are now down 12.6% y/y.

In trend terms, Job Ads fell 0.3% m/m and 11.1% y/y.

	Seasonally adjusted			Trend	
	Number	% m/m	% y/y	% m/m	% y/y
Total job ads	153,260	-1.7	-12.6	-0.3	-11.1

See page 4 for [technical details](#)

ANZ Senior Economist, Catherine Birch, commented:

ANZ Job Ads slid a further 1.7% m/m in November and are now down almost 15% from their cyclical peak in May 2018.

Although there has been a longer lag than usual, the downturn in the number of advertisements may be starting to filter through to the labour market. In October, we saw the first substantial fall (-19k) in employment in three years (a small 1k employment drop was recorded in May 2018).

We expect employment growth to decline into 2020, lagging the deterioration in GDP growth over the past year. While we expect the [Q3 GDP data](#) (Wednesday 4 December) to show growth starting to gradually pick up from its low, the fact that the ANZ Job Ads figure is still falling suggests that the softness in the labour market has a way to run.

ANZ Job Ads fell 1.7% in November

Nov 2019	158,309	153,260	-1.7	-12.6	155,383	-0.3	-11.1

The internet series counts the average number of job ads carried by each of the sites contributing to the series on the same day of each week in the month indicated. The day (which is not necessarily the same for each site) is selected by the site operator as broadly representative of its activity levels.

The data are based on information provided by the operators of the following sites: Seek.com.au, and the Department of Employment's Australian JobSearch site (Jobsearch.gov.au).

(a) Concurrent seasonal adjustment method (see [Technical Appendix](#) for further details).

(b) The trend estimates came from applying a 13-term Henderson moving average to the seasonally adjusted series. This smoothing technique enables estimates to be produced for the latest month, but it also results in revisions to the most recent six months as additional observations become available.

ANZ Job Ads in relation to other indicators

The ANZ Job Advertisements series uses a concurrent seasonal adjustment methodology to derive the seasonal adjustment factors. This means that data from the current month are used in estimating seasonal factors for the current and previous months. Concurrent seasonal adjustment replaced the forward factor methodology from the June 2010 reference month.

The concurrent adjustment methodology uses the most recent data every month, whereas the forward factor approach used it only once a year. Under concurrent adjustment, the seasonal factors will also be more responsive to underlying dynamic changes than forward factors.

Concurrent adjustment can result in revisions to the seasonal factors each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the seasonal adjustment factors for the current month, the previous month and the same month a year ago.

The concurrent seasonal adjustment brings the ANZ Job Advertisements series in line with the methodology used by the ABS for its monthly employment data.

State and territory charts have been discontinued.

Note for editors

For some of the newspapers surveyed, the ANZ Job Advertisements series counts the number of advertisement 'bookings'. Each booking may contain multiple advertisements. In addition, the series counts classified advertisements only, and does not include display advertisements. For these reasons, it would be incorrect to draw any inference or correlation from the ANZ Job Advertisements series regarding advertising volumes or revenues from employment advertising in the newspapers surveyed. The series is not intended as and should not be used as a tool to assess the financial performance of any of the newspapers it draws information from.
